LONDON:

PRINTED AND PUBLISHED BY HIS MAJESTY'S STATIONERY OFFICE.

To be purchased directly from H.M. STATIONERY OFFICE at the following addresses:

Adastral House, Kingsway, London, W.C.2; 120, George Street, Edinburgh;

York Street, Manchester; 1, St. Andrew's Crescent, Cardiff;

15, Donegall Square West, Belfast;

or through any Bookseller.

1932.

Price 6d. net.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 9TH JANUARY, 1932.

BIRTHS AND DEATHS.

In the 117 County Boroughs and Great Towns of England and Wales the live births registered in the first week of the year numbered 6,908 corresponding to an annual rate of 17·6 per 1,000 living: stillbirths numbered 291 corresponding to a rate of 40 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 6,755 including 412 deaths from influenza.

The figures for the individual weeks up to Jan. 2 relate to the 107 towns as in 1931 and to the 117 towns (representing 3 per cent. more population) in Table 1 thereafter. The totals in the last two columns relate to the 106 towns on both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrars after from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

GENERAL REMARKS.

SUNDAY ..	3	0'0	7'9	Overcast till 22h.; then partially cloudy. Damping 2h. till 3h. Brisk wind throughout, with high wind 12h. till 16h.
MONDAY ..	4	0'0	8'0	Partially cloudy till 3h.; then overcast. Brisk wind till 3h.; from 9h. till 16h.; and from 18h. Occasional damping between 15h. and 21h.; and from 21 $\frac{1}{2}$ h. till 23h.
TUESDAY ..	5	0'0	8'0	Cloudless till 6h.; then overcast generally. Brisk wind till 1h.; from 11h. till 16h.; and from 19h. Frequent damping between 18 $\frac{1}{2}$ h. and 21h. Squally rain from 21 $\frac{1}{2}$ h. Dew in morning.
WEDNESDAY	6	0'0	8'0	Overcast generally. Squally rain till 2 $\frac{1}{2}$ h.; and from 10 $\frac{1}{2}$ h. till 17 $\frac{1}{2}$ h. Damping 4h. till 7h. Heavy rain 18 $\frac{1}{2}$ h. till 19h. Rain 21 $\frac{1}{2}$ h. till 22 $\frac{1}{2}$ h. Brisk wind till 13h.; high wind till 17h.; gale till 19h.; then decreasing to brisk wind by 22h till 23h.
THURSDAY	7	1'1	8'0	Nearly cloudless till 3h.; nearly overcast till 14 $\frac{1}{2}$ h.; variably cloudy till 21 $\frac{1}{2}$ h.; then overcast. Damping 12 $\frac{1}{2}$ h. till 13 $\frac{1}{2}$ h.; then rain till 13 $\frac{1}{2}$ h. Mist 14h. till 22h.
FRIDAY ..	8	0'8	8'1	Overcast till 11h.; variably cloudy till 19 $\frac{1}{2}$ h.; then cloudless. Fog 7h. till 14h.; mist till 18h.; thick fog till 19h.; then fog. Hoar frost in morning and at night.
SATURDAY	9	4'0	8'1	Cloudless till 12 $\frac{1}{2}$ h.; then nearly overcast. Fog 1 $\frac{1}{2}$ h. till 10 $\frac{1}{2}$ h. Damping 14 $\frac{1}{2}$ h. till 14 $\frac{1}{2}$ h.; and from 18h. Hoar frost in morning.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 15 $\frac{1}{2}$ feet above the mean level of the sea: no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower," than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are:—P, positive; N, negative; L, low; m, moderate; h, high; d, disturbed or unsteady conditions. L, h., signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 28, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29'83 ins. at the beginning of the week to 30'06 ins. by 11h. on 4th; decreased to 28'86 ins. by 10h. on 6th; increased to 29'34 ins. by 9h. on 7th; decreased to 29'19 ins. by 0h. on 8th; increased to 29'61 ins. by 11h. on 9th; decreased and was 29'34 ins. by midnight on the same day.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 16th JANUARY, 1932.

BIRTHS AND DEATHS.

In the 117 County Boroughs and Great Towns of England and Wales the live births registered in the second week of the year numbered 6,529 corresponding to an annual rate of 16.6 per 1,000 living: stillbirths numbered 284 corresponding to a rate of 42 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 6,286 (469 less than the number in the preceding week), including 412 deaths from influenza, the same number as in the preceding week.

* 107 Great Towns.

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 87, against 74, 101, and 100 in the preceding three weeks.

In London (Administrative County including the City of London) there were 1,351 live births registered corresponding to an annual rate of 16·1 per 1,000 living: stillbirths numbered 51 corresponding to a rate of 36 per 1,000 total births (including stillborn): the civilian deaths (excluding stillbirths) numbered 1,509 (14 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 69, against 64, 95, and 71 in the preceding three weeks.

Notifications of Infectious Diseases.

	England and Wales.			London (Administrative County).		
	Actual.	Expected.	Per cent.	Actual.	Expected.	Per cent.

The figures for the individual weeks up to Jan. 2 relate to the 107 towns as in 1931 and to the 117 towns (representing 3 per cent. more population) in Table 1 thereafter. The totals in the last two columns relate to the 106 towns on both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrars. For from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

DATE.	ATMOSPHERIC ELECTRICITY (For explanation of symbols, see Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.	
Sunday ..	10 IN till 12h.; mN till 19h.; then IN.	0'0	8'1	Overcast. Damping till 3h.; then rain generally till 22 $\frac{1}{2}$ h.; and from 23 $\frac{1}{2}$ h. Strong wind till 8h.; then fresh wind till 21h.	<p>The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the column of the barometer is 163 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.</p> <p>Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.</p> <p>The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average.</p> <p>The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.</p> <p>The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are:—P. positive; N. negative; L. low; m. moderate; h. high; d. disturbed or unsteady conditions. L, h, signify potential less than 150 volts and greater than 500 volts, respectively.</p> <p>The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of <i>bright</i> sunshine on each day.</p> <p>The reading of the barometer decreased from 29.34 ins. at the beginning of the week to 29.03 ins. by 19h. on 10th; increased to 29.73 ins. by 17h. on 12th; decreased to 29.44 ins. by 7h. on 13th; increased to 30.05 ins. by 11h. on 14th; decreased to 29.71 ins. by 3h. on 15th; increased to 30.08 ins. by 21h. on 16th; decreased and was 29.79 ins. by midnight on the 16th.</p>

THE CLINICAL RESEARCH ASSOCIATION, LTD.

WATERGATE HOUSE, ADELPHI, W.C.2. (*Close to Charing Cross Station.*)

A COMPLETE LABORATORY SERVICE.

The Consulting Rooms and Laboratories of this Association (established in 1894) are available for all Medical Practitioners desiring Laboratory assistance in the investigation and diagnosis of cases under their care. All necessary apparatus and full instructions for collecting pathogenic material, or for the personal attendance of Patients at the Consulting Rooms of the Association, will be forwarded immediately on application.

X-RAY EXAMINATIONS AND NURSING HOME ACCOMMODATION ARRANGED.

W. J. CURRY, *Secretary.*

Telephone: TEMPLE BAR 8983 (3 lines).

Telegrams: "TUBERCLE, WESTRAND, LONDON."

The Registrar-General's Statistical Review of England and Wales, 1930.

Price 6d. net.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 23rd JANUARY, 1932.

BIRTHS AND DEATHS.

In the 117 County Boroughs and Great Towns of England and Wales the live births registered in the second week of the year numbered 6,451 corresponding to an annual rate of 16.5 per 1,000 living: stillbirths numbered 287 corresponding to a rate of 43 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 5,749 (537 less than the number in the preceding week), including 392 deaths from influenza, as compared with 412 in each of the preceding two weeks.

* 107 Great Towns.

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 79, against 101, 100, and 87 in the preceding three weeks.

In London (Administrative County including the City of London) there were 1,380 live births registered corresponding to an annual rate of 16.4 per 1,000 living: stillbirths numbered 47 corresponding to a rate of 33 per 1,000 total births (including stillborn): the civilian deaths (excluding stillbirths) numbered 1,381 (128 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 86, against 95, 71, and 69 in the preceding three weeks.

MONTHLY STATEMENT OF DEATHS FROM SMALL-POX IN ENGLAND AND WALES.

Small-pox was mentioned as a cause of death in one case in the returns received from areas outside Greater London, the County Boroughs and Great Towns, for the month of December last. This death has been provisionally classified to small-pox and assigned to Alfreton U.D. (Derby).

Notifications of Infectious Diseases.

The figures for the individual weeks up to Jan 2 relate to the 107 towns as in 1931 and to the 117 towns (representing 93 per cent. more population) in Table 1 thereafter. The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrars after from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

DATE. JANUARY.	ATMOSPHERIC ELECTRICITY (For explanation of symbols, see Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.	
Sunday .. 17	No record till 11h.; mP till 23h.; then IP.	1'5	8'4	Variably cloudy. Damping 6h. till 1h.; then squally rain till 3h. Fresh wind till 12h. Occasional lunar halo between 18h. and 20h.	
Monday .. 18	IP till 10h.; mP till 18h.; then IP.	0'0	8'4	Overcast till 18h.; partially cloudy till 21h.; then overcast. Damping 6h. till 7h. and at 18h.	
Tuesday .. 19	IP till 12h.; mP till 23h.; then IP.	0'0	8'5	Overcast. Slight shower at 6h. Mist till 18h.; then fog.	
Wednesday .. 20	IP till 8h.; then mP	0'1	8'5	Overcast till 14h.; variably cloudy till 17h.; then cloudless. Fog till 3h.; and from 17h. Mist 3h. till 9h.	
Thursday .. 21	mP till 8h.; then no record.	5'3	8'6	Cloudless till 4h.; nearly overcast till 10h.; nearly cloudless till 22h.; then cloudy. Fog 3h. till 8h.; mist 8h. till 12h.; and from 18h. Hear frost in morning and at night.	
Friday .. 22	no record till 12h.; then mP.	0'0	8'6	Partially cloudy till 6h.; then overcast. Mist and frequent damping from 7h. Lunar halo 1h. till 2h. Hear frost in morning.	
Saturday .. 23.	mP	0'0	8'6	Overcast till 18h.; then becoming cloud- less by 19h. Frequent damping till 9h. Thick fog from 20h. Dew at night.	
No of Column ..	26	Sum 6'9	Sum 59'6	27	28

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 182 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that "+" indicates "higher," and - "lower" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: -P, positive; N, negative; L, low; m, moderate; h, high; d, disturbed or unsteady conditions. I, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 28 derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of *bright* sunshine on 2479 days.

The reading of the barometer decreased from 29.79 ins. at the beginning of the week to 29.74 ins. by 3h. on 17th; increased to 30.37 ins. by 9h. on 19th; decreased to 30.22 ins. by 16h. on 21st; increased to 30.56 ins. by 21h. on 23rd; decreased and was 30.64 ins. by midnight on the same day.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 30th JANUARY, 1932.

BIRTHS AND DEATHS.

In the 117 County Boroughs and Great Towns of England and Wales the live births registered in the fourth week of the year numbered 6,025 corresponding to an annual rate of 15·4 per 1,000 living: stillbirths numbered 263 corresponding to a rate of 42 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths corrected as far as possible for non-residents numbered 5,238 (511 less than the number in the preceding week), including 313 deaths from influenza, as compared with 412, 412, and 392 in the preceding three weeks.

* Including Peptic Ulcer

Table 3.—Notifications of Infectious Diseases.

Number of cases (civilians) notified in the week ended 30th January, 1932, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

	Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).		Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).

* The figures for the individual weeks up to Jan. 2 relate to the 107 towns as in 1931 and to the 117 towns (representing about 3 per cent. more population) in Table 1 thereafter. The totals in the last two columns relate to the 107 towns common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrar-General and differ from those published for the towns in the Quarterly Return which are corrected for births occurring at a distance from the usual residence of the parents.

Sum		2.7	Sum 61.9		
No of Column ..		27	28		

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the eastern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The mean of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 60 years ending 1903. With the corrected mean readings of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1903, and that of horizontal movement of the air from a discussion of the anemometric records for the 60 years ending 1916. In reading columns 8 and 23 it will be borne in mind that *x* indicates "higher," and *y* "lower" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: -P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unduly conditions; *l₁*, *h₁*, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 23, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of bright sunshine on each day.

The reading of the barometer decreased from 30.64 ins. at the beginning of the week to 30.41 ins. by 14h. on 24th; increased to 30.78 ins. by 11h. on 28th; decreased to 30.44 ins. by 4h. on 29th; increased and was 30.61 ins. by midnight on the 30th.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 6th FEBRUARY, 1932.

BIRTHS AND DEATHS.

In the 117 County Boroughs and Great Towns of England and Wales the live births registered in the fifth week of the year numbered 6,436 corresponding to an annual rate of 16.4 per 1,000 living: stillbirths numbered 273 corresponding to a rate of 41 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths corrected as far as possible for non-residents numbered 5,738 (500 more than the number in the preceding week), including 278 deaths from influenza, as compared with 412, 392, and 313 in the preceding three weeks.

Annual Death-Rates.

* The figures for the individual weeks up to Jan 2 relate to the 107 towns as in 1931 and to the 117 towns (representing about 3 per cent. more population) in Table 1 thereafter. The totals in the last two columns relate to the 108 towns common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrar-General and differ from those published for the towns in the Quarterly Return which are corrected for births occurring from the usual residence of the parents.

The results apply to the Civil Day or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometer. The mean daily dew point temperature and degree of humidity are deduced from the mean daily value of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 85 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 30 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*," and "*lower*" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are — P positive; N, negative; L, low; m, moderate; h, high; d, disturbed or unusually conditions. *I_a*, *I_n*, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of *bright* sunshine on each day. The reading of the barometer increased from 30.61 ins. at the beginning of the week to 30.69 ins. by 10h. on January 31st; decreased generally and was 30.18 ins. by midnight on February 6th.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 13th FEBRUARY, 1932.

BIRTHS AND DEATHS.

In the 117 County Boroughs and Great Towns of England and Wales the live births registered in the sixth week of the year numbered 5,842 corresponding to an annual rate of 14.9 per 1,000 living: stillbirths numbered 279 corresponding to a rate of 46 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths corrected as far as possible for non-residents numbered 5,748 (10 more than the number in the preceding week), including 279 deaths from influenza, as compared with 392, 313, and 278 in the preceding three weeks.

Annual Death-Rates.

* Including Peptic Ulcer.

Table 3.—Notifications of Infectious Diseases.

Number of cases (civilians) notified in the week ended 13th February, 1932, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the 7th column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Encephalitis hargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

	Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).		Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).

* The figures for the individual weeks up to Jan 2 relate to the 107 towns as in 1931 and to the 117 towns (representing about 3 percent. more population) in Table 1 thereafter. The totals in the last two columns relate to the 106 common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrar and differ from those published for the towns in the Quarterly Return which are corrected for births occurring from the usual residence of the parents.

Adastral House, Kingsway, London, W.C.2; 120, George Street, Edinburgh;

York Street, Manchester; 1, St. Andrew's Crescent, Cardiff;

15, Donegall Square West, Belfast;

or through any Bookseller.

1932.

Price 6d. net.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 20th FEBRUARY, 1932.

BIRTHS AND DEATHS.

In the 117 County Boroughs and Great Towns of England and Wales the live births registered in the seventh week of the year numbered 6,743 corresponding to an annual rate of 17.2 per 1,000 living: stillbirths numbered 295 corresponding to a rate of 42 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths corrected as far as possible for non-residents numbered 6,370 (622 more than the number in the preceding week), including 364 deaths from influenza, as compared with 313, 278, and 279 in the preceding three weeks.

Annual Death-Rates.

		Jan. 30, 1932.	Feb. 6, 1932.	Feb. 13, 1932.	Feb. 20, 1932.

* The figures for the individual weeks up to Jan 2 relate to the 107 towns as in 1931 and to the 117 towns (representing about 3 per cent. more population) in Table 1 thereafter. The totals in the last two columns relate to the 108 towns common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring outside the usual residence of the parents.

DATE. FEBRUARY.	ATMOSPHERIC ELECTRICITY. (For explanation of symbols, see Note.)	Registered Sunshine in hours.	Sun above horizon in hours.	GENERAL REMARKS.	
Sunday ..	14 Variably mP and IP till 17h.; then variably mP and IN.	4.3	9.9	Variably cloudy till 11h.; then overcast. Damping 3p. till 6h. Slight showers at 17h.; 18h.; and 23h. Mist till 10h.; and from 14h. till 15h.	<p>The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 162 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.</p> <p>Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.</p> <p>The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 55 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.</p> <p>The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: - P. positive; N. negative; l. low; m. moderate; h. high; d. disturbed or unsteady conditions. I_1, I_2, signify potential less than 150 volts and greater than 500 volts, respectively.</p> <p>The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of <i>bright</i> sunshine on each day.</p> <p>The reading of the barometer increased generally from 30.10 ins. at the beginning of the week to 30.53 ins. by 10h. on 18th; decreased to 30.44 ins. by 16h. on 18th; increased and was 30.63 ins. by midnight on the 20th.</p>
Monday ..	15 mP till 4h.; mN till 5h.; then mP.	0.1	9.9	Overcast generally. Slight rain 4h. till 6h. Shower 11h. Mist in morning.	
Tuesday ..	16 mP	0.0	10.0	Overcast till 15h.; then variably cloudy. Rain 4h. till 15h.; and 8h. till 9h. Lunar halo 20h. till 21h. Mist in morning; and from 18h. Hoar frost at night.	
Wednesday	17 mP till 14h.; then variably mP and IP.	0.0	10.0	Overcast. Mist till 7h.; then fog till 11h. Dew at night.	
Thursday ..	18 IP till 8h.; then vari- ably mP and IP.	6.6	10.1	Overcast till 3h.; then cloudless gener- ally. Fog 7h. till 9h. Hoar frost in morning and at night.	
Friday ..	19 mP till 12h.; then variably mP and IP.	0.0	10.2	Very cloudy till 4h.; then overcast. Mist and hoar frost in morning.	
Saturday ..	20 No record	0.0	10.2	Overcast Damping 9h. till 1h.; and at 8h.

LONDON:

PRINTED AND PUBLISHED BY HIS MAJESTY'S STATIONERY OFFICE.

To be purchased directly from H.M. STATIONERY OFFICE at the following addresses:
Adastral House, Kingsway, London, W.C.2; 120, George Street, Edinburgh;
York Street, Manchester; 1, St. Andrew's Crescent, Cardiff;
15, Donegall Square West, Belfast;
or through any Bookseller.

1932.

Price 6d. net.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 27th FEBRUARY, 1932.

BIRTHS AND DEATHS.

In the 117 County Boroughs and Great Towns of England and Wales the live births registered in the eighth week of the year numbered 6,485 corresponding to an annual rate of 16.5 per 1,000 living: stillbirths numbered 307 corresponding to a rate of 45 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths corrected as far as possible for non-residents numbered 6,404 (34 more than the number in the preceding week), including 324 deaths from influenza, as compared with 278, 279, and 364 in the preceding three weeks.

Annual Death-Rates.

		Feb. 6, 1932.	Feb. 13, 1932.	Feb. 20, 1932.	Feb. 27, 1932.

Manchester	17.1	15.2	18.5	19.1
Newcastle-upon-Tyne	13.2	13.8	13.6	17.7
Nottingham	13.3	12.9	16.0	15.0
Sheffield	13.9	14.0	18.6	15.3
Stoke-on-Trent	14.2	13.4	17.0	15.6
West Ham	15.1	12.7	15.5	13.7

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 95, against 83, 85, and 94 in the preceding three weeks.

In London (Administrative County including the City of London) there were 1,273 live births registered corresponding to an annual rate of 15.2 per 1,000 living: stillbirths numbered 54 corresponding to a rate of 41 per 1,000 total births (including stillborn): the civilian deaths (excluding stillbirths) numbered 1,362 (13 more than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 72, against 63, 57, and 61 in the preceding three weeks.

MONTHLY STATEMENT OF DEATHS FROM SMALL-POX IN ENGLAND AND WALES.

There was no death from Small-pox in the returns received from areas outside Greater London, the County Boroughs and Great Towns, for the month of January last.

Notifications of Infectious Diseases.

	England and Wales.			London (Administrative County).		
	Actual.	Expected.	Per cent.	Actual.	Expected.	Per cent.
Scarlet fever ...	1,429	1,792	80	216	247	87

* The figures for the individual weeks up to Jan 2 relate to the 107 towns as in 1931 and to the 117 towns (representing about 3 per cent. more population) in Table 1 thereafter. The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrar-General and differ from those published for the towns in the Quarterly Return which are corrected for births occurring from the usual residence of the parents.

				Sum 9.3	Sum 73.7	28
No of Column ..				27	26	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 55 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: - P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions. l, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26 derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of bright sunshine on each day.

The reading of the barometer decreased generally from 30.83 ins. at the beginning of the week to 29.81 ins. by 8h. on 24th; increased to 30.17 ins. by 10h. on 25th; decreased to 30.08 ins. by 5h. on 26th; increased generally and was 30.13 ins. by midnight on the 27th.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 5th MARCH, 1932.

BIRTHS AND DEATHS.

In the 117 County Boroughs and Great Towns of England and Wales the live births registered in the ninth week of the year numbered 6,385 corresponding to an annual rate of 16.3 per 1,000 living; stillbirths numbered 301 corresponding to a rate of 45 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths corrected as far as possible for non-residents numbered 6,024 (380 less than the number in the preceding week), including 298 deaths from influenza, as compared with 279, 364, and 324 in the preceding three weeks.

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 87, against 85, 94, and 95 in the preceding three weeks.

In London (Administrative County including the City of London) there were 1,276 live births registered corresponding to an annual rate of 15.2 per 1,000 living; stillbirths numbered 41 corresponding to a rate of 31 per 1,000 total births (including stillborn): the civilian deaths (excluding stillbirths) numbered 1,260 (102 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 54, against 57, 61, and 72 in the preceding three weeks.

ENGLAND AND WALES.

DEATH-RATES FROM TUBERCULOSIS AND CANCER, AND MATERNAL MORTALITY—1931.

Provisional death-rates per million population for England and Wales during the year 1931 are as follows:—

	Males.	Females.	Persons.
Respiratory Tuberculosis ...	872	622	742
Other Tuberculosis ...	169	140	154
Cancer ...	1,450	1,516	1,484

The maternal mortality (provisional) based on deaths primarily classed to puerperal conditions is as follows:—

Puerperal Sepsis per 1,000 Live Births 1.66, per 1,000 Total Births 1.59.

Other accidents and diseases of pregnancy and parturition per 1,000 Live Births 2.45, per 1,000 Total Births 2.35.

Table 1.—117 County Boroughs and Great Towns, Greater London, and Four Scottish and Irish Towns.

BIRTHS and DEATHS* registered in the week ended 5th March, 1932.

* Including Ulcer of Stomach or Duodenum.

Table 3.—Notifications of Infectious Diseases.

Number of cases (civilians) notified in the week ended 5th March, 1932, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown in the names of Counties include any associated County Boroughs. The letters in the 6th column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

	Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).		Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).

* The figures for the individual weeks up to Jan 2 relate to the 107 towns as in 1931 and to the 117 towns (representing about 3 per cent. more population) in Table 1 thereafter. The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrar-General and differ from those published for the towns in the Quarterly Return which are corrected for births occurring at a distance from the usual residence of the parents.

No. of Column				Sum 26.2	Sum 76.9	27
				26	25	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 153 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h, A.M., noon, 3h, P.M., and 9h, P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1903, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1903. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined. The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: - P, positive; N, negative; L, low; M, moderate; H, high; d, disturbed or unsteady conditions; L, H, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 28, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of bright sunshine on each day.

The reading of the barometer increased from 30.13 ins. at the beginning of the month to 30.17 ins. by 11h on Feb. 28th; decreased to 29.68 ins. by 15h, on March 2nd; increased to 29.84 ins. by 12h, on March 4th; decreased and was 29.49 ins. by midnight on March 5th.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 12th MARCH, 1932.

BIRTHS AND DEATHS.

In the 117 County Boroughs and Great Towns of England and Wales the live births registered in the tenth week of the year numbered 6,313 corresponding to an annual rate of 16.1 per 1,000 living: stillbirths numbered 312 corresponding to a rate of 47 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths corrected as far as possible for non-residents numbered 6,092 (68 more than the number in the preceding week), including 292 deaths from influenza, as compared with 364, 324, and 298 in the preceding three weeks.

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 87, against 94, 95, and 87 in the preceding three weeks.

* The figures for the individual weeks up to Jan 2 relate to the 107 towns as in 1931 and to the 117 towns (representing about 3 per cent. more population) in Table I thereafter. The totals in the last two columns relate to the 106 to 107 towns common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrar-General and differ from those published for the towns in the Quarterly Return which are corrected for births occurring at a distance from the usual residence of the parents.

Table 5.—Meteorology in certain Towns during the Week ended Saturday, 12th March, 1933

The results apply to the Civil Day or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are:—P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions; l, h., signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26 derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29.49 ins. at the beginning of the week to 29.37 ins. by 2h. on 6th.; increased to 29.74 ins. by 12h. on 7th.; decreased to 29.65 ins. by 4h. on 8th.; increased to 29.83 ins. by 23h. on 9th.; decreased to 29.72 ins. by 16h. on 10th.; increased to 30.10 ins. by 9h. on 12th.; decreased and was 30.07 ins. by midnight on the same day.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 19th MARCH, 1932.

BIRTHS AND DEATHS.

In the 117 County Boroughs and Great Towns of England and Wales the live births registered in the eleventh week of the year numbered 6,757 corresponding to an annual rate of 17.2 per 1,000 living: stillbirths numbered 291 corresponding to a rate of 41 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths corrected as far as possible for non-residents numbered 6,194 (102 more than the number in the preceding week), including 230 deaths from influenza, as compared with 324, 298, and 292 in the preceding three weeks. Deaths from measles numbered 116 as compared with 64, 76 and 81 in the preceding three weeks.

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 87, against 95, 87, and 87 in the preceding three weeks.

* The figures for the individual weeks up to Jan. 2 relate to the 107 towns as in 1931 and to the 117 towns (representing about 3 per cent. more population) in Table 1 thereafter. The totals in the last two columns relate to the 108 towns common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrar-General and differ from those published for the towns in the Quarterly Return which are corrected for births occurring at a distance from the usual residence of the parents.

DATE.		ATMOSPHERIC ELECTRICITY. (For explanation of symbols, see Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.
MARCH					
Sunday	13		6.4	11.7	Variably cloudy till 10h.; then cloudless. Mist till 9h.; fog till 11h.; then mist till 14h. Hoar frost in morning and at night.
Monday	14		7.1	11.8	Cloudless till 20h.; then overcast from 20h. Fog 1h. till 10h. Hoar frost in morning.
Tuesday	15		2.2	11.8	Nearly cloudless till 4h.; overcast till 12h.; very cloudy till 15h.; then cloudless generally. Fog 5h. till 8h. Damping at 8h. Hoar frost in morning and at night.
Wednesday	16		6.8	11.9	Partially cloudy till 1h.; overcast till 10h.; then cloudless. Fog 2h. till 8h. Damping 5h. till 6h. Hoar frost at night.
Thursday	17		0.3	12.0	Overcast generally. Mist till 9h. Hoar frost in morning.
Friday	18		0.5	12.0	Variably cloudy till 7h.; overcast till 13h.; then becoming cloudless by 19h. Hoar frost in morning and at night.
Saturday	19		4.2	12.1	Cloudless till 10h.; overcast till 14h.; partially cloudy till 16h.; then overcast. Fog 2h. till 11h. Solar halo 14h. Hoar frost in morning.
			Sum 27.5	Sum 83.3	
			26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*," and - "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are -P positive; A, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions, L, H, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 28, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of *brilliant* sunshine on each day. The reading of the barometer decreased from 30.07 ins. at the beginning of the week to 29.88 ins. by 15h. on 14th; increased to 30.14 ins. by 11h. on 16th; decreased generally to 29.86 ins. by 16h. on 17th; increased generally and was 30.12 ins. by midnight on the 19th.

Observations suspended during building operations.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 55 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: - P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions; l, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 30.07 ins. at the beginning of the week to 29.93 ins. by 15h. on 14th; increased to 30.14 ins. by 11h. on 15th; decreased generally to 29.86 ins. by 16h. on 17th; increased generally and was 30.12 ins. by midnight on the 19th.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 26th MARCH, 1932.

BIRTHS AND DEATHS.

In the 117 County Boroughs and Great Towns of England and Wales the live births registered in the twelfth week of the year numbered 5,785 corresponding to an annual rate of 14·7 per 1,000 living: stillbirths numbered 268 corresponding to a rate of 44 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths corrected as far as possible for non-residents numbered 5,688 (506 less than the number in the preceding week), including 212 deaths from influenza, as compared with 298, 292, and 230 in the preceding three weeks. Deaths from measles numbered 124 as compared with 76, 81, and 116 in the preceding three weeks.

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 83, against 87, 87, and 87 in the preceding three weeks.

* Including Ulcer of stomach or duodenum.

Table 3.—Notifications of Infectious Diseases.

Number of cases (civilians) notified in the week ended 26th March, 1932, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the columns denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia; N, Puerperal pyrexia.

	Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).		Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).

* The figures for the individual weeks up to Jan 2 relate to the 107 towns as in 1931 and to the 117 towns (representing about 3 per cent. more population) in Table 1 thereafter. The totals in the last two columns relate to the 106 common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrar-General and differ from those published for the towns in the Quarterly Return which are corrected for births occurring from the usual residence of the parents.

* As from 1st January, 1932, an improved formula for interpreting the records of the Robinson anemometer was brought into use, and in conjunction with the introduction of this change the normal or mean values of horizontal movement of the air, with which daily records are compared, were similarly changed, in order that there might be no anomaly in the comparison.

The results apply to the Civil Day or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 55 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 18 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: - P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions; l, h., signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 23, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 30.12 ins. at the beginning of the week to 30.16 ins. by 22h. on 26th; decreased generally to 29.46 ins. by 5h. on 26th; increased and was 29.60 ins. by midnight on the same day.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 2nd APRIL, 1932.

BIRTHS AND DEATHS.

In the 117 County Boroughs and Great Towns of England and Wales the live births registered in the thirteenth week of the year numbered 6,391 corresponding to an annual rate of 16.3 per 1,000 living: stillbirths numbered 313 corresponding to a rate of 47 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths corrected as far as possible for non-residents numbered 5,465 (223 less than the number in the preceding week), including 158 deaths from influenza, as compared with 292, 230, and 212 in the preceding three weeks. Deaths from measles numbered 114 as compared with 81, 116, and 124 in the preceding three weeks.

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 78, against 87, 87, and 83 in the preceding three weeks.

West Ham	15.1	14.6	14.4	12.5

In London (Administrative County including the City of London) there were 1,331 live births registered corresponding to an annual rate of 15.9 per 1,000 living: stillbirths numbered 51 corresponding to a rate of 37 per 1,000 total births (including stillborn): the civilian deaths (excluding stillbirths) numbered 1,262 (28 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 62, against 78, 84, and 71 in the preceding three weeks. Deaths from measles numbered 65, as compared with 36, 47 and 45 in the preceding three weeks.

During the week Small-pox was mentioned as a cause of death in one case which has been provisionally classified to Small-pox and assigned to Deptford Met. Borough.

Notifications of Infectious Diseases.

	England and Wales.			London (Administrative County).		
	Actual.	Expected.	Per cent.	Actual.	Expected.	Per cent.

* The totals in the last two columns relate to the 108 towns common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

* As from 1st January, 1932, an improved formula for interpreting the records of the Robinson anemometer was brought into use, and in conjunction with the introduction of this change the normal or mean values of horizontal movement of the air, with which daily records are compared, were similarly changed, in order that there might be no anomaly in the comparison.

DATE.	MAROH	ATMOSPHERIC ELECTRICITY. (For explanation of symbols, see Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.	
Sunday	27		0.0	12.6	Overcast. Damping till 04h. Occasional slight showers between 12h. and 15h. Rain 15h. till 22h. Fresh wind from 18h.	
Monday	28		4.5	12.7	Overcast till 7h.; very cloudy generally till 9h.; nearly overcast till 12h.; very cloudy till 17h.; then becoming nearly cloudless by 13h. Fresh wind till 3h. Rain 9h. till 14h.; and 44h. till 64h. Occasional showers between 14h. and 15h.; and at 16h. till 17h. Hail 13h.	
Tuesday	29		3.3	12.7	Variably cloudy till 10h.; then overcast. Rain 14h. till 15h. Shower at 19h. Fresh wind from 21h.	
Wednesday	30		5.0	12.8	Nearly overcast till 11h.; then variably cloudy. Rain 6h. till 74h. Showers at 13h.; and 15h. Fresh wind till 7h.; and from 9h. till 15h. Strong wind 1h. till 6h. Dew at night.	
Thursday	31		2.9	12.9	Nearly overcast generally till 6h.; then overcast. Damping 4h. till 6h.; 19h. till 20h.; and 21h. till 23h. Heavy shower with hail 16h. till 17h. Occasional solar halo between 12h. and 15h.	
APRIL Friday	1		1.1	12.9	Overcast generally. Damping 6h. till 7h.; 204h. till 244h.; then rain. Shower at 184h.	
Saturday	2		4.2	13.0	Nearly overcast till 9h.; variably cloudy till 13h.; overcast till 204h.; then variably cloudy. Rain till 1h. Shower at 24h. Damping 154h. till 184h.

		Observations temporarily suspended during building operations.		25		

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: - P. positive; N. negative; l. low; m. moderate; h. high; d. disturbed or unsteady conditions. l., h., signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of bright sunshine on each day.

The reading of the barometer increased from 29.60 ins. at the beginning of the week to 29.62 ins. by 7h. on March 27th; decreased to 29.25 ins. by 23h. on March 27th; increased to 29.46 ins. by 11h. on March 28th; decreased to 29.12 ins. by 6h. on March 30th; increased to 29.49 ins. by 8h. on April 1st; decreased generally and was 28.99 ins. by midnight on April 2nd.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 9th APRIL, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the fourteenth week of the year numbered 7,050 corresponding to an annual rate of 17.9 per 1,000 living: stillbirths numbered 342 corresponding to a rate of 46 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths corrected as far as possible for non-residents numbered 5,353 (112 less than the number in the preceding week), including 114 deaths from influenza, as compared with 230, 212, and 158 in the preceding three weeks. Deaths from measles numbered 139 as compared with 116, 124, and 114 in the preceding three weeks.

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 80, against 87, 83, and 78 in the preceding three weeks.

* As from 1st January, 1932, an improved formula for interpreting the records of the Robinson anemometer was brought into use, and in conjunction with the introduction of this change the normal or mean values of horizontal movement of the air, with which daily records are compared, were similarly changed, in order that there might be no anomaly in the comparison.

DATE.	ATMOSPHERIC ELECTRICITY. (For explanation of symbols, see Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.
APRIL				
Sunday .. 3		0.3	13.1	Overcast generally. Damping 2h. till 34h.; generally from 114h. till 143h.; and 18h. till 183h. Rain 34h. till 74h.; 124h. till 13h.; and 133h. till 143h. Showers 16h. till 164h.
Monday .. 4		2.6	13.1	Overcast till 12h.; then variably cloudy. Slight rain 7h. till 3h.
Tuesday .. 5		5.7	13.2	Overcast till 10h.; partially cloudy till 194h.; then nearly overcast.
Wednesday 6		0.0	13.3	Overcast. Slight showers between 6h. and 7h.; and at 183h. Rain from 244h. Fresh wind from 9h.; rising to strong 12h. till 16h.
Thursday .. 7		7.9	13.3	Nearly overcast till 12h.; then variably cloudy. Rain till 5h.; from 63h. till 7h.; 16h. till 163h.; at 183h.; and at 21h. Fresh wind throughout, rising to strong 9h. till 19h.
Friday .. 8		5.3	13.4	Variably cloudy till 4h.; nearly overcast till 12h.; variably cloudy till 17h.; then cloudless generally. Showers at 5h.; 7h.; 12h.; and 193h. Rain 144h. till 154h.; then rain till 154h. Fresh wind till 18h.
Saturday .. 9		1.0	13.4	Partially cloudy till 4h.; overcast generally till 193h.; then variably cloudy. Rain 64h. till 83h. Damping 94h. till 10h.; 104h. till 193h.; and occasionally between 16h. and 173h. Fresh wind from 6h. Dew at night.
	Observations temporarily suspended during building operations.	Sum 22.8 96	Sum 92.8 27	

The results apply to the Civil Day or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 162 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 60 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are - P, positive; N, negative; L, low; m, moderate; h, high; d, disturbed or unsteady conditions; L, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of bright sunshine on each day.

The readings of the barometer decreased from 28.99 ins. at the beginning of the week to 28.94 ins. by 5h. on April 3rd; increased to 29.07 ins. by 30h. on April 6th; decreased to 29.22 ins. by 6h. on April 7th; increased to 29.01 ins. by 0h. on April 9th; decreased and was 29.52 ins. by midnight on the same day.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 16th APRIL, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the fifteenth week of the year numbered 7,052 corresponding to an annual rate of 17·9 per 1,000 living: stillbirths numbered 276 corresponding to a rate of 38 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths corrected as far as possible for non-residents numbered 4,966 (387 less than the number in the preceding week), including 85 deaths from influenza, as compared with 212, 158, and 114 in the preceding three weeks. Deaths from measles numbered 132 as compared with 124, 114, and 139 in the preceding three weeks.

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 77, against 83, 78, and 80 in the preceding three weeks.

In London (Administrative County including the City of London) there were 1,397 live births registered corresponding to an annual rate of 16.7 per 1,000 living: stillbirths numbered 42 corresponding to a rate of 29 per 1,000 total births (including stillborn): the civilian deaths (excluding stillbirths) numbered 1,085 (108 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 74, against 71, 62, and 71 in the preceding three weeks. Deaths from measles numbered 61, as compared with 45, 65 and 66 in the preceding three weeks.

During the week Small-pox was mentioned as a cause of death in one case which has been provisionally classified to Small-pox and assigned to London (Camberwell Met. Borough).

Notifications of Infectious Diseases.

	England and Wales.			London (Administrative County).		
	Actual.	Expected.	Per cent.	Actual.	Expected.	Per cent.
Scarlet fever	1,512	1,522	99	234	201	116

* The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

* As from 1st January, 1932, an improved formula for interpreting the records of the Robinson anemometer was brought into use, and in conjunction with the introduction of this change the normal or mean values of horizontal movement of the air, with which daily records are compared, were similarly changed, in order that there might be no anomaly in the comparison.

Saturday .. 16		0.0	13.9	Partially cloudy till 2h.; then overcast. Slight rain 5h. till 10h.; and frequently from 10h. till 21h.; then rain. Mist from 15h.	
No of Column ..		Sum 22.0	Sum 96.0		27
		26	25	Observations temporarily suspended during building operations.	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the stem of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*," and - "*lower*" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: - P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions, l, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 2952 ins. at the beginning of the week to 29.25 ins. by 19h. on April 10th; increased to 30.31 ins. by 8h. on April 13th; decreased to 29.95 ins. by 4h. on April 15th; increased generally and was 29.85 ins. by midnight on April 16th.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 23rd APRIL, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the sixteenth week of the year numbered 6,994 corresponding to an annual rate of 17·8 per 1,000 living: stillbirths numbered 319 corresponding to a rate of 44 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths corrected as far as possible for non-residents numbered 4,789 (177 less than the number in the preceding week), including 78 deaths from influenza, as compared with 158, 114, and 85 in the preceding three weeks. Deaths from measles numbered 109 as compared with 114, 139, and 132 in the preceding three weeks.

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 62, against 78, 80, and 77 in the preceding three weeks.

West Ham	12.5	13.5	12.8	13.0

In London (Administrative County including the City of London) there were 1,407 live births registered corresponding to an annual rate of 16.8 per 1,000 living: stillbirths numbered 71 corresponding to a rate of 48 per 1,000 total births (including stillborn): the civilian deaths (excluding stillbirths) numbered 995 (90 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 48, against 62, 71, and 74 in the preceding three weeks. Deaths from measles numbered 48, as compared with 65, 66 and 61 in the preceding three weeks.

MONTHLY STATEMENT OF DEATHS FROM SMALL-POX IN ENGLAND AND WALES.

There was no death from Small-pox in the returns received from areas outside Greater London, the County Boroughs and Great Towns, for the month of March last.

Notifications of Infectious Diseases.

	England and Wales.			London (Administrative County).		
	Actual.	Expected.	Per cent.	Actual.	Expected.	Per cent.
Scarlet fever	1,632	1,502	109	250	200	125
Diphtheria	772	888	87	130	203	64
Acute pneumonia (primary or influenzal).	994	1,136	88	84	106	79
Enteric (including Paratyphoid) fever.	18	47	38	4	?	?

The numbers of "expected" notifications shown in the above table are based on the Median Value of the corresponding weeks of 1923-31.

Table 1.—118 County Boroughs and Great Towns, Greater London, and Four Scottish and Irish Towns.

BIRTHS and DEATHS* registered in the week ended 29th April, 1932.

TOWNS.		ESTIMATED RESIDENT POPULATION, MID. 1931.	LIVE BIRTHS.	STILLBIRTHS.	DEATHS (excluding Stillbirths).	Deaths of Infants under 1 Year of Age.	Including Deaths from						
							Typhoid and Para-typhoid fevers.	Measles.	Scarlet fever.	Whooping cough.	Diphtheria.	Influenza.	Diarrhoea and Enteritis under 2 years.

* Including Ulcer of stomach or duodenum.

Table 3.—Notifications of Infectious Diseases.

Number of cases (civilians) notified in the week ended 23rd April, 1932, in
Administrative Areas and Port Sanitary Districts with Summary for
England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown
against the names of Counties include any associated County Boroughs. The letters in the
last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever;
D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Encephalitis
hæmorrhagica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia
neonatorum; N, Puerperal pyrexia.

	Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).		Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).

* As from 1st January, 1932, an improved formula for interpreting the records of the Robinson anemometer was brought into use, and in conjunction with the introduction of this change the normal or mean values of horizontal movement of the air, with which daily records are compared, were similarly changed, in order that there might be no anomaly in the comparison.

DATE.	ATMOSPHERIC ELECTRICITY. (For explanation of symbols, see Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.	
APRIL					
Sunday .. 17		0.0	14.0	Overcast throughout. (Rain till 2h.; then occasional damping till 13h. Slight mist till 9h.	
Monday .. 18		5.4	14.0	Overcast till 2½h.; partially cloudy till 10h.; then overcast generally.	
Tuesday .. 19		0.6	14.1	Overcast generally.	
Wednesday 20		1.7	14.2	Nearly overcast till 15h.; then variably cloudy. Showers at 10h.; 11½h.; occasionally between 12h. and 15h.; and at 17h. Rain 2½h. till 21½h.	
Thursday .. 21		8.7	14.2	Cloudless till 7½h.; variably cloudy till 21h.; then cloudless. Showers at 9½h.; 11½h.; 13½h. and 14½h. Heavy showers at 16½h. till 16¾h.; and with hail 18h. till 18½h. Fresh wind 10h. till 17h.	
Friday .. 22		9.8	14.3	Cloudless till 7h.; very cloudy generally till 16h.; partially cloudy till 20½h.; then cloudless generally. Hoar frost in morning. Dew at night.	
Saturday .. 23		5.8	14.4	Cloudless till 3h.; nearly overcast till 12h.; partially cloudy till 18h.; very cloudy till 19h.; then cloudless. Slight shower at 7½h. Rain 9½h. till 10½h. Dew and hoar frost at night.	
No of Column ..	25	26	Sum 99.2	Sum 99.2	27

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 162 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1906, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*," and - "*lower*" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are:—P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions. "h," "h," signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29.66 ins. at the beginning of the week to 29.86 ins. by 23h. on April 18th; decreased to 29.42 ins. by 16h. on April 20th; increased generally and was 29.67 ins. by midnight on April 23rd.

Observations suspended during building operations.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 30th APRIL, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the seventeenth week of the year numbered 6,829 corresponding to an annual rate of 17·3 per 1,000 living: stillbirths numbered 300 corresponding to a rate of 42 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,747 (42 less than the number in the preceding week). Deaths from measles numbered 94 as compared with 139, 132, and 109 in the preceding three weeks.

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 69, against 80, 77, and 62 in the preceding three weeks.

* The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

* As from 1st January, 1932, an improved formula for interpreting the records of the Robinson anemometer was brought into use, and in conjunction with the introduction of this change the normal or mean values of horizontal movement of the air, with which daily records are compared, were similarly changed, in order that there might be no anomaly in the comparison.

No of Column ..		25			

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.
Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometers are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 60 years ending 1903. With the corrected mean reading of the dry bulb thermometer is combined the corrected mean of the readings of the maximum and minimum thermometers forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.
The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 60 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "lighter," and "lower" than the average.
The values given in column 18 are not corrected for the index error of the thermometer, which cannot be determined.
The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: +, positive; -, negative; l, low; m, moderate; h, high; d, disturbed or unusually conditions. l, h, signify potential less than 150 volts and greater than 500 volts, respectively.
The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of <i>brilliant</i> sunshine on each day.
The reading of the barometer increased from 29.67 ins. at the beginning of the week to 29.86 ins. by 7h. on April 25th; decreased generally to 29.37 ins. by 13h. on April 28th; increased generally to 29.54 by 9h. on April 30th; decreased and was 29.62 ins. by midnight on the same day.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 60 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 55 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916, in reading columns 8 and 23 it will be borne in mind that + indicates "*higher*," and - "*lower*" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are -P, positive; N, negative; L, low; m, moderate; h, high; d, disturbed or unsteady conditions. I_1 , I_2 , signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29.87 ins. at the beginning of the week to 29.86 ins. by 7h. on April 26th; decreased generally to 29.37 ins. by 13h. on April 28th; increased generally to 29.64 by 9h. on April 30th; decreased and was 29.62 ins. by midnight on the same day.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 7th MAY, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the eighteenth week of the year numbered 6,717 corresponding to an annual rate of 17.1 per 1,000 living: stillbirths numbered 316 corresponding to a rate of 45 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,606 (141 less than the number in the preceding week). Deaths from measles numbered 87 as compared with 132, 109 and 94 in the preceding three weeks.

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 67, against 77, 62, and 69 in the preceding three weeks.

* Including Ulcer of stomach or duodenum.

Table 3.—Notifications of Infectious Diseases.

Number of cases (civilians) notified in the week ended 7th May, 1932, in
Administrative Areas and Port Sanitary Districts with Summary for
England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown
against the names of Counties include any associated County Boroughs. The letters in the
last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever;
D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Encephalitis
epidemic; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia
epidemic; N, Puerperal pyrexia.

	Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).		Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).

The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

DATE.		ATMOSPHERIC ELECTRICITY. (For explanation of symbols, see Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.	
MAY						
Sunday ..	1		3.2	14.8	Very cloudy till 5h.; nearly overcast till 11h.; very cloudy till 17h.; then overcast. Rain 18h. till 19h.; and from 22h. Slight rain generally between 20h. and 22h. Mist 6h. till 11h.	
Monday ..	2		0.2	14.9	Overcast. Rain till 6h. Occasional damping from 17h. Shower at 23h.	
Tuesday ..	3		0.0	11.9	Overcast throughout. Rain or damping generally. Fresh wind from 20h.	
Wednesday	4		0.1	15.0	Overcast till 16h.; then variably cloudy. Fresh wind till 6h. Occasional damping 15h. till 20h.	
Thursday ..	5		2.8	15.1	Variably cloudy till 9h.; nearly overcast till 15h.; then variably cloudy. Occasional showers between 9h. and 13h.; and at 15h.; 16h.; 17h. and 20h. Hail at 12h.	
Friday ..	6		1.8	15.1	Partially cloudy till 2h.; then overcast generally. Shower 14h. Hoar frost in morning.	
Saturday ..	7		3.8	15.2	Nearly overcast with cloudy intervals till 24h.; partially cloudy till 23h.; then cloudless. Occasional slight rain between 5h. and 6h. Shower 18h. till 18h. Haze 9h. till 18h. Hoar frost at night.	
			Sum 11.9	Sum 105.0		
No of Column ..		25	26	27		

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 182 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.	The observations are usually taken at 8h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.	The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 55 years ending 1903, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.	The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: -P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions. l, h, signify potential less than 150 volts and greater than 500 volts, respectively.	The numbers in column 28, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of bright sunshine on each day.	The reading of the barometer decreased from 29.62 ins. at the beginning of the week to 29.41 ins. by 3h. on May 2nd; increased to 29.82 ins. by 8h. on May 4th; decreased generally and was 29.62 ins. by midnight on May 7th.
---	---	---	--	--	--

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the eastern of the barometer is 15' feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M. and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a comparison of the photographic records made during the 50 years ending 1903. With the corrected mean readings of the dry bulb thermometer, is combined the corrected mean readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by means of the tables published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 85 years ending 1905, and that of horizontal equivalent of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: -P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions; l, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 28, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of bright sunshine on each day. The reading of the barometer decreased from 29.52 ins. at the beginning of the week to 29.41 ins. by 3h. on May 2nd; increased to 29.52 ins. by 8h. on May 4th; decreased generally and was 29.52 ins. by midnight on May 7th.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 14th MAY, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the nineteenth week of the year numbered 6,931 corresponding to an annual rate of 17.6 per 1,000 living: stillbirths numbered 336 corresponding to a rate of 46 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,731 (125 more than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 70, against 62, 69, and 67 in the preceding three weeks.

* Including Ulcer of stomach or duodenum.

Table 3.—Notifications of Infectious Diseases.

Number of cases (civilians) notified in the week ended 14th May, 1932, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the 1st column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Encephalitis thargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

	Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).		Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).

* The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

DATE.		ATMOSPHERIC ELECTRICITY. (For explanation of symbols, see Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.	
MAY						
Sunday	8		7.4	15.2	Partially cloudy generally till 9h.; cloudy till 13h.; nearly overcast till 18h.; then partially cloudy. Hoar frost in morning and at night.	<p>The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the stem of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.</p> <p>Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.</p> <p>The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1918. In reading columns 8 and 23 it will be borne in mind that + indicates "<i>higher</i>," and "<i>lower</i>" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.</p> <p>The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: -P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions; l, h, signify potential less than 150 volts and greater than 500 volts, respectively.</p> <p>The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of <i>bright</i> sunshine on each day.</p> <p>The reading of the barometer decreased from 29.62 ins. at the beginning of the week to 29.31 ins. by 10h. on 8th; increased to 29.83 ins. by 22h. on 10th; decreased to 29.62 ins. by 9h. on 13th; increased to 29.83 ins. by 9h. on 14th; decreased and was 29.77 ins. by midnight on the same day.</p>
Monday	9		0.0	15.3	Overcast till 18h.; then partially cloudy. Occasional showers 3h. till 6h.; then rain till 17h.	
Tuesday	10		7.3	15.3	Partially cloudy till 9h.; very cloudy till 19h.; then cloudless. Shower 11h. till 11h. Haze and hoar frost in morning. Partial solar halo 17h.	
Wednesday	11		0.4	15.4	Overcast. Rain 3h. till 4h.; and 20h. till 20h. Damping 4h. till 8h. Showers at 11h.; 14h., 15h. and 18h.	
Thursday	12		3.0	15.5	Nearly overcast till 16h.; partially cloudy till 18h.; then overcast. Fresh wind 8h. till 19h.	
Friday	13		0.2	15.5	Overcast generally. Slight showers between 5h. and 6h. Rain 11h. till 11h.; and occasionally between 12h. and 19h. Dew at night.	
Saturday	14		4.7	15.6	Overcast till 10h.; variably cloudy till 15h.; then overcast. Occasional slight rain from 22h.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 21st MAY, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the twentieth week of the year numbered 5,859 corresponding to an annual rate of 14.9 per 1,000 living: stillbirths numbered 264 corresponding to a rate of 43 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,354 (377 less than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 63, against 69, 67, and 70 in the preceding three weeks.

Annual Death-Rates.

DATE.		ATMOSPHERIC ELECTRICITY. (For explanation of symbols, see Note.)	Registered Electricity in hours.	Sun above Horizon in hours.	GENERAL REMARKS.
MAY					
Sunday	15		1.5	15.8	Overcast till 12h.; very cloudy till 14h.; then overcast. Slight rain 4h. till 8h.; then rain till 9h.; and from 18h. till 19h. Occasional damping 9h. till 11h. Shower at 14h. Heavy rain between 17h. and 18h. Thunder and lightning at 17h. Mist from 19h.
Monday	16		0.3	15.7	Overcast. Slight rain 1h. till 14h.; 4h. till 4h.; and from 22h. Rain 9h. till 10h.; 10h. till 11h.; and 19h. till 19h. Occasional damping 11h. till 13h.; and at 16h.
Tuesday	17		13.2	15.7	Overcast till 2h.; partially cloudy till 16h.; then cloudy generally. Haze in morning. Dew at night.
Wednesday	18		4.6	15.7	Partially cloudy till 5h.; very cloudy till 9h.; then overcast. Slight rain 15h. till 16h. Dew in morning.
Thursday	19		10.5	15.8	Overcast till 8h.; partially cloudy generally till 23h.; then overcast. Slight rain about 6h. Lightning 21h. till 21h. Dew at night.
Friday	20		2.3	15.8	Partially cloudy till 3h.; overcast till 13h.; partially cloudy till 16h.; then overcast. Shower at 5h. Slight rain 11h. till 12h.; at 17h.; and occasionally between 21h. and 22h. Frequent lightning and occasional thunder between 21h. and 23h.
Saturday	21		4.2	15.9	Variably cloudy till 12h.; then overcast. Damping 15h. till 20h.; and from 23h. Rain 20h. till 22h.
		Observations temporarily suspended during building operations.	Sum 38.6	Sum 110.2	
No of Column		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.	Observations are usually taken at 6h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometers are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.	The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average.	The values given in column 18 are not corrected for the index error of the thermometer, which cannot be determined.	The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are -P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unusually conditions, l, h, signify potential less than 150 volts and greater than 500 volts, respectively.	The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of <i>bright</i> sunshine on each day.	The reading of the barometer decreased from 29.77 ins. at the beginning of the week to 28.51 ins. by 2h. on 16th; increased to 30.72 ins. by 6h. on 16th; decreased generally and was 29.47 ins. by midnight on the 21st.
---	--	---	---	--	--	---

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 162 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 6h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates *higher*, and - *lower* than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are:—P, positive; A, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions; n, n., signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of *bright* sunshine on each day. The readings of the barometer decreased from 29.77 ins. at the beginning of the week to 29.51 ins. by 2h. on 16th; increased to 30.02 ins. by 5h. on 18th; decreased generally and was 29.97 ins. by midnight on the 21st.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 28th MAY, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the twenty-first week of the year numbered 7,217 corresponding to an annual rate of 18.3 per 1,000 living: stillbirths numbered 270 corresponding to a rate of 36 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,087 (267 less than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 56, against 67, 70, and 63 in the preceding three weeks.

In London (Administrative County including the City of London) there were 1,449 live births registered corresponding to an annual rate of 17.3 per 1,000 living : stillbirths numbered 51 corresponding to a rate of 34 per 1,000 total births (including stillborn): the civilian deaths (excluding stillbirths) numbered 831 (115 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 50, against 59, 69, and 73 in the preceding three weeks.

During the week Small-pox was mentioned as a cause of death in one case which has been provisionally classified to small-pox and assigned to London (Bermondsey Met. Borough).

MONTHLY STATEMENT OF DEATHS FROM SMALL-POX IN ENGLAND AND WALES.

There was no death from small-pox in the returns received from areas outside Greater London, the County Boroughs and Great Towns for the month of April last.

Notifications of Infectious Diseases.

	England and Wales.			London (Administrative County).		
	Actual.	Expected.	Per cent.	Actual.	Expected.	Per cent.
Scarlet fever	1,346	1,493	90	250	234	107
Diphtheria	681	814	84	145	224	65
Acute pneumonia (primary or influenzal).	832	1,021	81	73	85	86
Enteric (including Paratyphoid) fever.	28	46	61	5	?	?

The numbers of "expected" notifications shown in the above table are based on the Median Value of the corresponding weeks of 1923-31.

Table 1.—118 County Boroughs and Great Towns, Greater London, and Four Scottish and Irish Towns.

BIRTHS and DEATHS* registered in the week ended 28th May, 1932.

* The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

DATE.		ATMOSPHERIC ELECTRICITY. (For explanation of symbols, see Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.
MAY					
Sunday	22		4.3	15.9	Overcast till 10h.; cloudy till 17h.; then overcast. Slight rain till 13h.; and from 4h. till 6h. Rain 14h. till 4h.; and heavy rain 17h. till 18h. Showers 14h. till 14h. Thunder and lightning 17h. till 17h.
Monday	23		2.0	18.0	Overcast generally till 15h.; partially cloudy till 17h.; then overcast. Showers at 3h., 10h. and 12h. Rain 4h. till 6h.; occasionally between 18h. and 20h.; and about 22h.
Tuesday	24		1.9	18.0	Nearly overcast till 17h.; then variably cloudy. Dew at night.
Wednesday	25		2.1	18.1	Partially cloudy till 6h.; then becoming overcast by 8h. Rain 15h. till 15h. Dew in morning.
Thursday	26		5.3	18.1	Partially cloudy till 10h.; then nearly overcast generally. Partial solar halo about 12h.
Friday	27		0.0	16.2	Overcast. Continuous slight rain from 6h.
Saturday	28		0.0	16.2	Overcast. Slight rain till 6h.; and occasionally between 11h. and 21h. Mist at night.
			Sum 16.6	Sum 112.5	
No of Column		25	28	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.	
Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.	
The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 9 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.	
The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are:—P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions. l, h, signify potential less than 150 volts and greater than 500 volts, respectively.	
The numbers in column 28, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of <i>bright</i> sunshine on each day.	
The readings of the barometer decreased from 29.4 ins. at the beginning of the week to 29.45 ins. by 1h. on 22nd; increased to 29.90 ins. by 21h. on 22nd; decreased to 29.50 ins. by 19h. on 23rd; increased generally and was 29.70 ins. by midnight on the 28th.	

The results apply to the Civil Day or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 66 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: - P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions. l, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 28, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29.47 ins. at the beginning of the week to 29.45 ins. by 1h. on 22nd; increased to 29.66 ins. by 21h. on 22nd; decreased to 29.50 ins. by 10h. on 23rd; increased generally and was 29.70 ins. by midnight on the 28th.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 4th JUNE, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the twenty-second week of the year numbered 7,279 corresponding to an annual rate of 18.5 per 1,000 living: stillbirths numbered 294 corresponding to a rate of 39 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,211 (124 more than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 54, against 70, 63, and 56 in the preceding three weeks.

Annual Death-Rates.

* The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

DATE.	ATMOSPHERIC ELECTRICITY. (For explanation of symbols, see Note.)		Sun above Horizon in hours.	Registered Sunshine in hours.	GENERAL REMARKS.
	DATE.				
	MAY				
Sunday ..	29		16.2	5.2	Overcast till 13 $\frac{1}{2}$ h.; then very cloudy generally. Slight rain about 8h.; and 10 $\frac{1}{2}$ h. till 11h. Dew at night.
Monday ..	30		18.2	4.4	Variably cloudy till 10 $\frac{1}{2}$ h.; nearly overcast till 17 $\frac{1}{2}$ h.; then partially cloudy generally. Slight rain 2h. till 3 $\frac{1}{2}$ h.; and 14 $\frac{1}{2}$ h. till 16 $\frac{1}{2}$ h. Shower at 5h. Haze from 16 $\frac{1}{2}$ h.
Tuesday ..	31		16.3	10.5	Partially cloudy till 20h.; then nearly overcast. Dew in morning.
JUNE Wednesday	1		16.3	2.8	Overcast till 14 $\frac{1}{2}$ h.; very cloudy till 18 $\frac{1}{2}$ h.; then overcast. Occasional slight rain between 7h. and 11 $\frac{1}{2}$ h.; and between 20 $\frac{1}{2}$ h. and 22 $\frac{1}{2}$ h.
Thursday ..	2		16.4	9.6	Overcast till 8 $\frac{1}{2}$ h.; partially cloudy generally till 22 $\frac{1}{2}$ h.; then overcast. Damping 4h. till 5h. Dew at night.
Friday ..	3		16.4	2.0	Overcast generally. Mist 4h. till 6h.
Saturday ..	4		16.4	0.0	Overcast. Damping 20h. till 20 $\frac{1}{2}$ h.; then slight rain.
			Sum 114.2	Sum 34.6	
No of Column ..		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 162 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1803. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 66 years ending 1803, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1816. In reading columns 8 and 23 it will be borne in mind that + indicates *higher*, and - *lower* than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: -1, positive N.; negative: 1, low; m, moderate; h, high; d, disturbed or unsteady conditions. h, h , signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 28, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of *brilliant* sunshine on each day.

The reading of the barometer increased from 29.70 ins. at the beginning of the week to 29.84 ins. by 21h. on May 30th; decreased to 29.60 ins. by 3h. on June 1st; increased generally and was 29.84 ins. by midnight on the 4th.

The Royal Sanitary Institute.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 11th JUNE, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the twenty-third week of the year numbered 7,001 corresponding to an annual rate of 17·8 per 1,000 living: stillbirths numbered 269 corresponding to a rate of 37 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,112 (99 less than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 61, against 63, 56, and 54 in the preceding three weeks.

* Including Ulcer of stomach or duodenum.

Table 3.—Notifications of Infectious Diseases.

Number of cases (civilians) notified in the week ended 11th June, 1932, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the 7th column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

		Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).			Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).

totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births
ved from the weekly returns furnished by the Registrars and differ from those published for the towns in the
y Return which are corrected for births occurring away from the usual residence of the parents.

DATE.	JUNE	ATMOSPHERIC ELECTRICITY. (For explanation of symbols, see Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.	
Sunday	5		0.1	16.4	Overcast till 17 ^h .; then partially cloudy. Slight rain till 7 ^h .; generally from 10 ^h . till 14 ^h .; from 15 ^h . till 15 ^h .; and 16 ^h till 17 ^h .	<p>The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 16$\frac{1}{2}$ feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.</p> <p>Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometers are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.</p> <p>The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 66 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.</p> <p>The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are -P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions; h, h., signify potential less than 160 volts and greater than 500 volts, respectively.</p> <p>The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of <i>bright</i> sunshine on each day.</p> <p>The reading of the barometer increased generally from 29.84 ins. at the beginning of the week to 30.09 ins. by 8h. on 9th; decreased to 29.70 ins. by 11h. on 11th; increased and was 29.77 ins. by midnight on the same day.</p>
Monday	6		4.7	18.5	Variably cloudy till 9h.; nearly overcast till 16 ^h .; partially cloudy till 18 ^h .; then overcast.	
Tuesday	7		7.6	16.5	Overcast till 8h.; cloudy generally till 15h.; partially cloudy till 22h.; then nearly overcast.	
Wednesday	8		0.1	16.5	Overcast. Slight shower at 5 ^h .	
Thursday	9		6.6	16.5	Overcast till 6h.; partially cloudy till 12h.; cloudy till 20h.; then partially cloudy. Dew at night	
Friday	10		12.8	16.6	Partially cloudy generally till 20h.; then nearly cloudless. Dew and hoar frost in morning.	
Saturday	11		3.4	16.6	Partially cloudy till 6h.; very cloudy till 9h.; then nearly overcast. Occasional slight rain. 6h. till 8h.; and 18h. till 21h. Dew in morning.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 18th JUNE, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the twenty-fourth week of the year numbered 6,816 corresponding to an annual rate of 17·3 per 1,000 living: stillbirths numbered 289 corresponding to a rate of 41 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,051 (61 less than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 53, against 56, 54, and 61 in the preceding three weeks.

Annual Death-Rates.

		May 28, 1932.	June 4, 1932.	June 11, 1932.	June 18, 1932.

* Including Ulcer of stomach or duodenum.

Table 3.—Notifications of Infectious Diseases.

Number of cases (civilians) notified in the week ended 18th June, 1932, in
Administrative Areas and Port Sanitary Districts with Summary for
England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown
against the names of Counties include any associated County Boroughs. The letters in the
last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever;
D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Encephalitis
herpetic; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia
neonatorum; N, Puerperal pyrexia.

	Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).		Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).

The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the early Return which are corrected for births occurring away from the usual residence of the parents.

Observations temporarily suspended during building operations.			25		

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the eastern of the barometer is 153 feet above the mean level of the sea: no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: -P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions, l, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 20, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of bright sunshine on each day.

The reading of the barometer increased generally from 29.77 ins. at the beginning of the week to 30.08 ins. by 8h. on June 15th; decreased generally and was 29.44 ins. by midnight on June 18th.

DIET AND NUTRITION

were among the Problems to which the Medical Research Council and the Ministry of Health devoted special publications during 1931.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 25th JUNE, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the twenty-fifth week of the year numbered 6,877 corresponding to an annual rate of 17.5 per 1,000 living: stillbirths numbered 298 corresponding to a rate of 42 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,833 (218 less than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 49, against 54, 61, and 53 in the preceding three weeks.

the totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births
 derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the
 early Return which are corrected for births occurring away from the usual residence of the parents.

No of Column ..	26	27	
Observations suspended temporarily during building operations.			25

The results apply to the Civil Day, or from midnight to midnight (Greenwich Mean Time). The height of the column of the barometer is 16 $\frac{1}{2}$ feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 60 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 66 years ending 1903, and that of horizontal movement of the air from a discussion of the anemometric records for the 60 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are -P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions. l, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of bright sunshine on each day.

The reading of the barometer decreased from 29.94 ins. at the beginning of the week to 29.83 ins. by 4h. on June 20th; increased generally to 30.11 ins. by 22h. on June 23rd; decreased generally and was 29.84 ins. by midnight on June 25th.

DIET AND NUTRITION

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are omitted from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 2nd JULY, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the twenty-sixth week of the year numbered 6,342 corresponding to an annual rate of 16.1 per 1,000 living: stillbirths numbered 275 corresponding to a rate of 42 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,941 (108 more than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 52, against 61, 53, and 49 in the preceding three weeks.

* totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births
 derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the
 1931 Return which are corrected for births occurring away from the usual residence of the parents.

DATE.	ATMOSPHERIC ELECTRICITY. (For explanation of symbols, see Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.	
Sunday ..	26	5.9	16.6	Variably cloudy till 11h.; nearly over- cast till 20h.; then partially cloudy.	
Monday ..	27	13.6	16.6	Nearly cloudless till 10h.; partially cloudy till 14h.; nearly cloudless till 21h.; then very cloudy. Haze in morning.	
Tuesday ..	28	9.4	16.6	Nearly overcast till 9h.; very cloudy till 17h.; then variably cloudy. Showers at 1h. and 18h.	
Wednesday	29	8.2	16.6	Variably cloudy till 8h.; nearly over- cast till 11h.; cloudy till 14h.; partially cloudy till 20h.; then variably cloudy.	
Thursday ..	30	0.0	16.6	Variably cloudy till 6h.; then overcast. Occasional rain from 6h. till 15h.; from 19h. till 19h.; and from 23h. Occasional damping between 19h. and 23h.	
JULY Friday ..	1	7.1	16.6	Overcast till 9h.; partially cloudy till 15h. cloudy till 22h.; then partially cloudy. Rain till 6h. Shower about 17h.	
Saturday ..	2	4.4	16.6	Nearly overcast generally till 11h.; very cloudy till 15h.; nearly overcast till 21h.; then partially cloudy. Showers at 5h. and 12h.	
No of Column ..	25	26	Sum 116.2	Sum 48.6	27

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*," and - "*lower*" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are:—P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions. *h*, *h*, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29.84 ins. at the beginning of the week to 29.57 ins. by 3h. on June 28th; increased to 29.81 ins. by 10h. on June 29th; decreased to 29.27 ins. by 7h. on July 1st; increased and was 29.87 ins. by midnight on July 2nd.

DIET AND NUTRITION

were among the Problems to which the Medical Research Council and the Ministry of Health devoted special publications during 1931.

AN INQUIRY INTO THE DIET OF 154 FAMILIES OF ST. ANDREWS. (M.R.C. Sp. Rpt. No. 151) 1s. (1s. 2d.)

THE PHYSIQUE AND HEALTH OF TWO AFRICAN TRIBES. A comparative study of the value of meat in diet. (M.R.C. Sp. Rpt. No. 155) 2s. (2s. 3d.)

NUTRITIONAL ANÆMIA IN INFANCY with Special Reference to Iron Deficiency. (M.R.C. Sp. Rpt. No. 157) 2s. (2s. 2d.)

THE INFLUENCE OF DIET ON CARIES IN CHILDREN'S TEETH. Interim Report by the Committee upon Dental Disease. (M.R.C. Sp. Rpt. No. 159) 6d. (7d.)

DIET AND THE TEETH. An Experimental Study. Part II.—A. Diet and Dental Disease; B. Diet and Dental Structure in Mammals other than the Dog. (M.R.C. Sp. Rpt. No. 153) 2s. 6d. (2s. 9d.)

MILK CONSUMPTION AND THE GROWTH OF SCHOOL CHILDREN. Report on an Investigation in Lanarkshire Schools, December, 1930 3d. (3½d.)

A MEMORANDUM ON BOVINE TUBERCULOSIS IN MAN, with Special Reference to Infection by Milk. (P.H. & M.S. Rpt. No. 63) 6d. (7d.)

The Royal Sanitary Institute

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 9th JULY, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the twenty-seventh week of the year numbered 6,761 corresponding to an annual rate of 17·2 per 1,000 living: stillbirths numbered 260 corresponding to a rate of 37 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,716 (225 less than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 48, against 53, 49, and 52 in the preceding three weeks.

Annual Death-Rates.

e totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births
rived from the weekly returns furnished by the Registrars and differ from those published for the towns in the
rly Return which are corrected for births occurring away from the usual residence of the parents.

DATE.	ATMOSPHERIC ELECTRICITY. (For explanation of symbols, see Note.)		Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.
	JULY				
Sunday ..	3		6'8	16'5	Partially cloudy till 8h.; very cloudy till 11h.; overcast till 14h.; very cloudy till 18h.; then nearly overcast. Dew in morning.
Monday ..	4		12'9	16'5	Partially cloudy till 20h.; then very cloudy.
Tuesday ..	5		0'0	16'5	Overcast generally. Slight showers at 8h. and 8h. Rain 4h. till 13h.; 18h. till 19h.; and from 20h. Slight rain occasionally between 18h. and 19h.
Wednesday	6		8'5	16'4	Variably cloudy. Dew at night.
Thursday ..	7		6'2	16'4	Partially cloudy till 11h.; nearly overcast till 17h.; very cloudy till 22h.; then becoming nearly cloudless by 23h. Slight rain 11h. till 11h. Rain 11h. till 13h. and 18h. till 17h. Shower at 14h.
Friday ..	8		10'2	16'4	Nearly cloudless till 4h.; partially cloudy till 15h.; overcast till 21h.; then partially cloudy.
Saturday ..	9		8'4	16'4	Nearly cloudless till 10h.; partially cloudy generally till 18h.; cloudy till 22h.; then cloudless. Haze till 21h. Dew in morning.
No of Column ..	25		Sum 53'0	Sum 115'1	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the column of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 50 years ending 1903, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1903. In reading columns 8 and 9 it will be borne in mind that + indicates "*higher*," and - "*lower*" than the average.

The values given in column 10 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: - F, positive; N, negative; L, low; M, moderate; H, high; D, disturbed or unsteady conditions; L, H, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 28, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29.87 ins. at the beginning of the week to 29.93 ins. by 11h. on July 3rd; decreased generally to 29.68 ins. by 17h. on July 6th; increased to 30.08 ins. by 8h. on July 8th; decreased and was 30.03 ins. by midnight on the same day.

DIET AND NUTRITION

were among the Problems to which the Medical Research Council and the Ministry of Health devoted special publications during 1931.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 16th JULY, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the twenty-eighth week of the year numbered 6,550 corresponding to an annual rate of 16.6 per 1,000 living: stillbirths numbered 294 corresponding to a rate of 43 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,897 (181 more than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 49, against 49, 52, and 48 in the preceding three weeks.

Annual Death-Rates.

* Including Ulcer of stomach or duodenum.

Table 3.—Notifications of Infectious Diseases.

Number of cases (civilians) notified in the week ended 16th July, 1932, in
Administrative Areas and Port Sanitary Districts with Summary for
England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

	Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).		Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).

the totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births
derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the
early Return which are corrected for births occurring away from the usual residence of the parents.

Sunday ..	10	Observations suspended temporarily during building operations.	11.7	16.3	Cloudless till 8h.; then partially cloudy generally. Dew at night.
Monday ..	11		5.6	16.3	Cloudless till 10½h.; very cloudy till 13h.; then overcast. Rain 13½h. till 16½h. Occasional thunder and lightning between 13h. and 15h. Haze 2h. till 13h. and from 17h. Dew in morning.
Tuesday ..	12		0.8	16.3	Overcast till 8h.; cloudless till 9½h.; overcast till 14½h.; cloudless till 16½h.; then overcast. Haze till 15½h. Dew at night.
Wednesday	13		1.0	16.3	Overcast till 20h.; then partially cloudy. Damping about 17½h. Dew in morning and at night.
Thursday ..	14		8.6	16.2	Partially cloudy till 11½h.; very cloudy till 12h.; then overcast. Slight rain 20½h. till 21½h. Dew in morning.
Friday ..	15		0 0	16.2	Overcast. Slight shower at 15½h.
Saturday ..	16		3.4	16.2	Very cloudy till 11½h.; partially cloudy till 16½h.; then overcast. Haze 9h. till 15h.
			Sum 31.1	Sum 113.8	
No of Column ..			26	27	

The results apply to the Civil Day, or from midnight to midnight, (Greenwich Mean Time. The height of the eastern of the barometer is 162 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 55 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*," and - "*lower*" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: - P, positive; N, negative; L, low; m, moderate; h, high; d, disturbed or unsteady conditions, L, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 25, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased generally from 30.03 ins. at the beginning of the week to 29.49 ins. by 16h. on July 15th; increased to 29.66 ins. by 22h. on July 14th; decreased to 29.43 ins. by 15h. on July 16th; increased and was 29.56 ins. by midnight on the same day.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the column of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 1). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 55 years ending 1903, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*," and - "*lower*" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are:—P, positive; N, negative; L, low; m, moderate; h, high; d, disturbed or unsteady conditions. L, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased generally from 30.03 ins. at the beginning of the week to 29.49 ins. by 16h. on July 15th; increased to 29.66 ins. by 22h. on July 14th; decreased to 29.43 ins. by 13h. on July 16th; increased and was 28.56 ins. by midnight on the same day.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 23rd JULY, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the twenty-ninth week of the year numbered 6,805 corresponding to an annual rate of 17·3 per 1,000 living: stillbirths numbered 264 corresponding to a rate of 37 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,621 (276 less than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 43, against 52, 48, and 49 in the preceding three weeks.

Annual Death-Rates.

The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the early Return which are corrected for births occurring away from the usual residence of the parents.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 192 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M. and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates " $\frac{1}{10}$ inch," and " $\frac{1}{100}$ inch" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are:—P, positive; N, negative; L, low; M, moderate; H, high; U, disturbed or unusually conditious; L, H, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of bright sunshine on each day.

The reading of the barometer increased from 28.66 ins. at the beginning of the week to 30.02 ins. by 0h. on July 19th; decreased generally to 29.61 ins. by 19h. on July 22nd; increased and was 28.79 ins. by midnight on July 23rd.

DIET AND NUTRITION

were among the Problems to which the Medical Research Council and the Ministry of Health devoted special publications during 1931.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 30th JULY, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the thirtieth week of the year numbered 6,599 corresponding to an annual rate of 16.8 per 1,000 living: stillbirths numbered 282 corresponding to a rate of 41 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,652 (31 more than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 53, against 48, 49, and 43 in the preceding three weeks.

Annual Death-Rates.

* The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Weekly Return which are corrected for births occurring away from the usual residence of the parents.

Observations suspended temporarily during building operations.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 55 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: -P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions. l, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 28, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of bright sunshine on each day.

The reading of the barometer decreased from 29.79 ins. at the beginning of the week to 29.40 ins. by 19h. on July 25th; increased generally to 29.68 ins. by 8h. on July 28th; decreased to 29.59 ins. by 15h. on July 28th; increased to 29.82 ins. by 22h. on July 29th; decreased and was 29.71 ins. by midnight on July 30th.

DIET AND NUTRITION

were among the Problems to which the Medical Research Council and the Ministry of Health devoted special publications during 1931.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 6th AUGUST, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the thirty-first week of the year numbered 5,925 corresponding to an annual rate of 15·0 per 1,000 living: stillbirths numbered 248 corresponding to a rate of 40 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,482 (170 less than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 44, against 49, 43, and 53 in the preceding three weeks.

* Including Ulcer of stomach or duodenum.

Table 3.—Notifications of Infectious Diseases.

Number of cases (civilians) notified in the week ended 6th August, 1932, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

	Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).		Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).

The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the early Return which are corrected for births occurring away from the usual residence of the parents.

DATE.	ATMOSPHERIC ELECTRICITY (For explanation of symbols, see Note.)		GENERAL REMARKS.	
	JULY			
Sunday ..	31	2'8	15'5	Cloudless till 2h.; overcast generally till 16h.; then cloudy. Slight rain 11h. till 11h.; and 20h. till 20h. Slight shower at 12h. Dew at night.
AUGUST Monday ..	1	2'9	15'4	Overcast generally. Shower 12h. Rain 13h. till 13h.; and generally from 14h. till 20h., with heavy rain between 14h. and 15h.; and from 18h. Thunder 12h. till 12h. Thunder and lightning from 13h. till 15h.; and 19h. till 20h.
Tuesday ..	2	0'6	15'4	Overcast. Heavy rain 18h. till 19h.
Wednesday	3	4'5	15'3	Overcast till 13h.; partially cloudy till 17h.; nearly cloudless till 19h.; then becoming overcast by 19h. Damping 8h. till 10h.; and 10h. till 11h. Slight dew at night.
Thursday ..	4	3'8	15'3	Overcast generally till 15h.; variably cloudy till 21h.; then partially cloudy. Dew in morning and at night.
Friday ..	5	4'8	15'2	Partially cloudy till 3h.; nearly overcast till 16h.; variably cloudy till 20h.; then nearly cloudless. Dew in morning.
Saturday ..	6	9'0	15'2	Nearly cloudless till 3h.; overcast till 8h.; cloudy or very cloudy till 20h.; little cloud from 21h. Dew in morning and at night.
No. of Column ..		Sum 28'4	Sum 107'3	27
		26		25

The results apply to the Civil Day or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean readings of the dry bulb thermometer is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 55 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: -p, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions; 1, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 28, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of bright sunshine on each day. The reading of the barometer decreases from 29.71 ins. at the beginning of August 29th to 29.63 ins. on August 19th, on August 31st, increased to 29.87 ins. by 8h. on August 29th, decreased to 29.78 ins. by 4h. on August 3rd; increased generally and was 30.01 ins. by midnight on August 7th.

DIET AND NUTRITION

were among the Problems to which the Medical Research Council and the Ministry of Health devoted special publications during 1931.

AN INQUIRY INTO THE DIET OF 154 FAMILIES OF ST. ANDREWS. (M.R.C. Sp. Rpt. No. 151) 1s. (1s. 2d.)

THE PHYSIQUE AND HEALTH OF TWO AFRICAN TRIBES. A comparative study of the value of meat in diet. (M.R.C. Sp. Rpt. No. 155) 2s. (2s. 3d.)

NUTRITIONAL ANÆMIA IN INFANCY with Special Reference to Iron Deficiency. (M.R.C. Sp. Rpt. No. 157) 2s. (2s. 2d.)

THE INFLUENCE OF DIET ON CARIES IN CHILDREN'S TEETH. Interim Report by the Committee upon Dental Disease. (M.R.C. Sp. Rpt. No. 159) 6d. (7d.)

DIET AND THE TEETH. An Experimental Study. Part II.—A. Diet and Dental Disease; B. Diet and Dental Structure in Mammals other than the Dog. (M.R.C. Sp. Rpt. No. 153) 2s. 6d. (2s. 9d.)

MILK CONSUMPTION AND THE GROWTH OF SCHOOL CHILDREN. Report on an Investigation in Lanarkshire Schools, December, 1930 3d. (3½d.)

A MEMORANDUM ON BOVINE TUBERCULOSIS IN MAN, with Special Reference to Infection by Milk. (P.H. & M.S. Rpt. No. 63) 6d. (7d.)

THE QUANTITATIVE ESTIMATION OF VITAMIN D BY RADIOGRAPHY. (M.R.C. Sp. Rpt. No. 158) 1s. (1s. 2d.)

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 13th AUGUST, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the thirty-second week of the year numbered 6,483 corresponding to an annual rate of 16·5 per 1,000 living: stillbirths numbered 287 corresponding to a rate of 42 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,816 (334 more than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 47, against 43, 53, and 44 in the preceding three weeks.

Annual Death-Rates.

* Including Ulcer of stomach or duodenum.

Table 3.—Notifications of Infectious Diseases.

Number of cases (civilians) notified in the week ended 13th August, 1932, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

	Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table)		Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table)

The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the quarterly Return which are corrected for births occurring away from the usual residence of the parents.

DATE.	ATMOSPHERIC ELECTRICITY. (For explanation of symbols, see Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.
AUGUST				
Sunday .. 7		8.7	15.1	Little cloud till 1h.; very cloudy generally by 2h. Clearing 20th. to cloudless by 21th. Dew in morning and at night.
Monday .. 8		12.2	15.0	Cloudless till 2h.; nearly overcast by 3h. Clearing 6h. few clouds generally from 7h. Dew in morning and at night.
Tuesday .. 9		5.0	15.0	Nearly cloudless till 5h.; nearly overcast till 10h. then partially cloudy. Sky hazy. Dew in morning and at night.
Wednesday 10		13.2	14.9	Cloudless or nearly so. Dew in morning and at night.
Thursday .. 11		12.6	14.9	Cloudless or nearly so. Dew in morning and at night.
Friday .. 12		5.4	14.8	Cloudless till 1h. nearly overcast by 2h. Cloudy 12th. till 20th.; nearly cloudless by 21h. Lightning 0h. Thunder 8h. 40m. till 7h. 10m. Thunderstorm with heavy rain 6h. 10m. till 7h. 10m. Distant lightning after 23h.
Saturday .. 13		12.6	14.3	Nearly cloudless till 7th.; then partially cloudy generally. Dew in morning and at night.
		Sum 69.7	Sum 104.5	
No. of Column ..	25	38	27	

The results apply to the Civil Day or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 55 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: -P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions; L, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 28 derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day. The reading of the barometer increased from 30.07 ins. at the beginning of the week to 30.10 ins. by 10h. on August 7th.; decreased to 29.60 ins. by 5h. on August 12th.; increased to 29.81 ins. by 9h. on August 13th.; decreased generally and was 29.79 ins. by midnight on the same day.

DIET AND NUTRITION

were among the Problems to which the Medical Research Council and the Ministry of Health devoted special publications during 1931.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 20th AUGUST, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the thirty-third week of the year numbered 6,369 corresponding to an annual rate of 16.2 per 1,000 living: stillbirths numbered 235 corresponding to a rate of 36 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,589 (227 less than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 43, against 53, 44, and 47 in the preceding three weeks.

Annual Death-Rates.

The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the early Return which are corrected for births occurring away from the usual residence of the parents.

Table 5.—Meteorology in certain Towns during the Week ended Saturday, 20th August, 1932. (Supplied by the Meteorological Office.)

No. of Column ..		25	26	Sum 46.8	Sum 101.7	27

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometers are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer is combined the corrected mean of the readings of the maximum and minimum thermometers forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 66 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 9 it will be borne in mind that + indicates "higher" and - "lower" than the average.

The values given in column 16 are not corrected for the index error of the thermometer which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are -P positive; N negative; l low; m moderate; h high; d disturbed or unsteady conditions; L, H, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26 derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of bright sunshine on each day. The reading of this meter decreased from 29.79 ins. at the beginning of the week to 29.74 ins. by 15h. on August 14h.; increased generally to 30.10 ins. by 9h. on August 18h.; decreased to 29.06 ins. by 22h. on August 20th; increased and was 29.09 ins. by midnight on the same day.

Observations suspended temporarily during building operations.

CENSUS OF ENGLAND AND WALES, 1931.

Volumes, issued by the Registrar-General, relating to Administrative Counties and the Local Government, Parliamentary and certain Judicial Areas therein, will be published in the order given below. These Volumes will include statistics relating to population (including Sex, Age and Marital Condition), Acreages, Private Families, Rooms, Dwellings and Institutions.

A price is inserted against each county for which the volume has been published—other volumes will follow in the order given, at short intervals.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 27th AUGUST, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the thirty-fourth week of the year numbered 6,619 corresponding to an annual rate of 16.8 per 1,000 living: stillbirths numbered 246 corresponding to a rate of 36 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,525 (64 less than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 57, against 44, 47, and 43 in the preceding three weeks.

The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the latterly Return which are corrected for births occurring away from the usual residence of the parents.

Thursday .. 25		8.3	14.0	Nearly overcast till 11½h.; partially cloudy generally till 20½h.; then very cloudy.	
Friday .. 26		2.9	14.0	Nearly overcast till 9½h.; partially cloudy till 13h.; overcast till 20½h.; partially cloudy till 21½h.; then cloudless. Rain 14½h. till 16½h.; then damping till 17½h. Haze 9½h. till 12½h. Dew at night.	
Saturday .. 27		7.7	13.9	Cloudless till 13½h.; partially cloudy till 20h.; then nearly cloudless generally. Mist 2h. till 9h. Haze from 12h. Dew in morning and at night.	
No. of Column ..		Sum 27.8	Sum 98.7		27
		26	25	Observations suspended temporarily during building operations.	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 80 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column *f*). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 85 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*," and - "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: -P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions. *l*, *m*, *h*, signify potential less than 150 volts and greater than 800 volts, respectively.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29.69 ins. at the beginning of the week to 30.20 ins. by 0h. on August 24th; decreased to 29.86 ins. by 12h. on August 26th; increased generally to 29.95 ins. by 22h. on August 27th; decreased and was 29.94 ins. by midnight on the same day.

CENSUS OF ENGLAND AND WALES, 1931.

Volumes, issued by the Registrar-General, relating to Administrative Counties and the Local Government, Parliamentary and certain Judicial Areas therein, will be published in the order given below. These Volumes will include statistics relating to population (including Sex, Age and Marital Condition), Acreages, Private Families, Rooms, Dwellings and Institutions.

A price is inserted against each county for which the volume has been published—other volumes will follow in the order given, at short intervals.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 3rd SEPTEMBER, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the thirty-fifth week of the year numbered 6,180 corresponding to an annual rate of 15.7 per 1,000 living: stillbirths numbered 252 corresponding to a rate of 39 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,628 (103 more than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 54, against 47, 43, and 57 in the preceding three weeks.

Annual Death-Rates.

The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

Saturday .. 3		0'0	13'5	Overcast till 20h.; partially cloudy till 21 $\frac{1}{2}$ h.; then cloudless. Damping 6 $\frac{1}{2}$ h. till 7h.; then rain till 13 $\frac{1}{2}$ h. Dew at night.
No. of Column ..	25	26	Sum 24'8 95'6	Sum 95'6 27

The results apply to the Civil Day or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 182 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 55 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1903. In reading columns 8 and 23 it will be borne in mind that + indicates "above", and - "below" than the average.

The values given in column 6 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are - F, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions; 1, h, signify potential less than 100 volts and greater than 500 volts, respectively.

The numbers in column 25, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of bright sunshine on each day.

The reading of the barometer decreased from 28.84 ins. at the beginning of the week to 29.64 ins. by 12h. on August 30th; increased to 30.04 ins. by 7h. on September 1st; decreased to 29.51 ins. by 13h. on September 3rd; increased and was 29.65 ins. by midnight on the same day.

Observations suspended temporarily during building operations.

CENSUS OF ENGLAND AND WALES, 1931.

Volumes, issued by the Registrar-General, relating to Administrative Counties and the Local Government, Parliamentary and certain Judicial Areas therein, will be published in the order given below. These Volumes will include statistics relating to population (including Sex, Age and Marital Condition), Acreages, Private Families, Rooms, Dwellings and Institutions.

A price is inserted against each county for which the volume has been published—other volumes will follow in the order given, at short intervals.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate, the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 10th SEPTEMBER, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the thirty-sixth week of the year numbered 6,083 corresponding to an annual rate of 15·4 per 1,000 living: stillbirths numbered 253 corresponding to a rate of 40 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,570 (58 less than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 53, against 43, 57, and 54 in the preceding three weeks.

* Including Ulcer of stomach or duodenum.

Table 3.—Notifications of Infectious Diseases.

Number of cases (civilians) notified in the week ended 10th September, 1932, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

	Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).		Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).

ie totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births
rived from the weekly returns furnished by the Registrars and differ from those published for the towns in the
erly Return which are corrected for births occurring away from the usual residence of the parents.

Wednesday 7	6.9	13.2	Very cloudy generally till 13h.; overcast till 16h.; then becoming nearly cloudless by 18h. Slight shower at 14h. Heavy rain 15h. till 15h. Solar halo 8h. till 9h. Dew at night.	
Thursday .. 8	0.2	13.1	Overcast generally. Occasional slight rain till 9h. Occasional damping between 12h. and 22h.	
Friday .. 9	8.3	13.1	Nearly overcast till 10h.; partially cloudy till 17h.; then cloudless. Dew at night.	
Saturday .. 10	0.4	13.0	Cloudless till 1h.; overcast till 17h.; partially cloudy till 20h.; then nearly cloudless. Shower at 9h. Rain 12h. till 17h.	
Sum 23.7		Sum 92.4		
No. of Column ..		25	27	

The results apply to the Civil Day or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 1b). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 46 years ending 1906, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1906. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: - P. positive; N. negative; L. low; M. moderate; H. high; d. disturbed or unsteady conditions; l. lightning, signify potential less than 150 volts and greater than 500 volts, respectively. The numbers in column 28, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of bright sunshine on each day.

The reading of the barometer increased from 29.65 ins. at the beginning of the week to 29.94 ins. by 6h. on September 5th; decreased to 29.45 ins. by 17h. on September 6th; increased to 29.58 ins. by 11h. on September 7th; decreased to 29.37 ins. by 10h. on September 8th; increased to 29.66 ins. by 21h. on September 9th; decreased and was 29.55 ins. by midnight on September 10th.

CENSUS OF ENGLAND AND WALES, 1931.

Volumes, issued by the Registrar-General, relating to Administrative Counties and the Local Government, Parliamentary and certain Judicial Areas therein, will be published in the order given below. These Volumes will include statistics relating to population (including Sex, Age and Marital Condition), Acreages, Private Families, Rooms, Dwellings and Institutions.

A price is inserted against each county for which the volume has been published—other volumes will follow in the order given, at short intervals.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 17th SEPTEMBER, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the thirty-seventh week of the year numbered 6,186 corresponding to an annual rate of 15.7 per 1,000 living: stillbirths numbered 257 corresponding to a rate of 40 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,750 (180 more than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 56, against 57. 54, and 53 in the preceding three weeks.

Annual Death-Rates.

* Including Ulcer of stomach or duodenum.

Table 3.—Notifications of Infectious Diseases.

Number of cases (civilians) notified in the week ended 17th September, 1932, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

	Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).		Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).

The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Weekly Return which are corrected for births occurring away from the usual residence of the parents.

DATE. SEPTEMBER	ATMOSPHERIC ELECTRICITY. (For explanation of symbols, see Note.)		GENERAL REMARKS.	
	Registered Sunshine in hours.	Sun above Horizon in hours.		
Sunday .. 11	3.9	12.9	Very cloudy till 3h.; overcast generally till 10 ³⁰ h.; then cloudy. Damping 8 ³⁰ h. till 9 ³⁰ h.; and at 11 ³⁰ h. Shower at 12h.	
Monday .. 12	4.7	12.9	Cloudy generally till 11h.; then overcast. Slight damping 20 ³⁰ h. till 21h. Dew in morning.	
Tuesday .. 13	0.1	12.8	Overcast, with cloudy period about 20 ³⁰ h. till 21h. Occasional damping between 6 ³⁰ h. and 8 ³⁰ h.; then slight rain till 9 ³⁰ h. Mist 9 ³⁰ h. till 13h.	
Wednesday .. 14	6.6	12.8	Overcast till 6h.; cloudy till 9h.; overcast till 13h.; partially cloudy till 19h.; then cloudless. Dew at night.	
Thursday .. 15	4.3	12.7	Cloudless till 10h.; overcast till 13 ³⁰ h.; partially cloudy till 16h.; then cloudless. Mist 4h. till 8 ³⁰ h. Dew in morning and at night.	
Friday .. 16	6.3	12.6	Cloudless till 3h.; overcast till 9 ³⁰ h.; then cloudless. Fog 2h. till 7h. Dew in morning and at night.	
Saturday .. 17	6.2	12.6	Cloudless till 4h.; overcast till 9 ³⁰ h.; then partially cloudy. Fog 2h. till 9 ³⁰ h.; then haze till 21h. Lunar halo 22h. till 23h. Dew in morning and at night.	
No. of Column ..	Sum 32.1	Sum 89.3		
	26	27		
	25		Observations suspended temporarily during building operations.	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the column of the barometer is 162 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1903, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916, in reading columns 8 and 23 it will be borne in mind that + indicates "*higher*," and - "*lower*" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are:—P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions; $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29.55 ins. at the beginning of the week to 29.31 ins. by 10h. on September 11th.; increased generally to 30.27 ins. by 9h. on September 15th.; decreased and was 29.72 ins. by midnight on September 17th.

CENSUS OF ENGLAND AND WALES, 1931.

Volumes, issued by the Registrar-General, relating to Administrative Counties and the Local Government, Parliamentary and certain Judicial Areas therein, will be published in the order given below. These Volumes will include statistics relating to population (including Sex, Age and Marital Condition), Acreages, Private Families, Rooms, Dwellings and Institutions.

A price is inserted against each county for which the volume has been published—other volumes will follow in the order given, at short intervals.

The Royal Sanitary Institute

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 24th SEPTEMBER, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the thirty-eighth week of the year numbered 5,944 corresponding to an annual rate of 15.1 per 1,000 living: stillbirths numbered 261 corresponding to a rate of 42 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,491 (259 less than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 50, against 54. 53, and 56 in the preceding three weeks.

the totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births
 derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the
 early Return which are corrected for births occurring away from the usual residence of the parents.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 162 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by the Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 55 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: - P. positive; N. negative; l. low; m. moderate; h. high; d. disturbed or unsteady conditions; l., h., signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29.72 ins. at the beginning of the week to 29.48 ins. by 19h. on September 18th; increased to 30.06 ins. by 10h. on September 21st; decreased to 29.33 ins. by 6h. on September 23rd; increased generally and was 29.41 ins. by midnight on September 24th.

Observations suspended temporarily during building operations.

CENSUS OF ENGLAND AND WALES, 1931.

Volumes, issued by the Registrar-General, relating to Administrative Counties and the Local Government, Parliamentary and certain Judicial Areas therein, will be published in the order given below. These Volumes will include statistics relating to population (including Sex, Age and Marital Condition), Acreages, Private Families, Rooms, Dwellings and Institutions.

A price is inserted against each county for which the volume has been published—other volumes will follow in the order given, at short intervals.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 1st OCTOBER, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the thirty-ninth week of the year numbered 6,054 corresponding to an annual rate of 15.4 per 1,000 living: stillbirths numbered 273 corresponding to a rate of 43 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,848 (357 more than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 54, against 53.56, and 50 in the preceding three weeks.

The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the quarterly Return which are corrected for births occurring away from the usual residence of the parents.

No. of Column ..	25				

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: - P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions; l, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26 derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of bright sunshine on each day. The reading of the barometer decreased from 29.42 ins. at the beginning of the week to 28.57 ins. by 16h. on September 25th; increased to 29.29 ins. by 12h. on September 28th; decreased to 29.56 ins. by 11h. on October 1st; increased and was 29.83 ins. by midnight on the same day.

CENSUS OF ENGLAND AND WALES, 1931.

Volumes, issued by the Registrar-General, relating to Administrative Counties and the Local Government, Parliamentary and certain Judicial Areas therein, will be published in the order given below. These Volumes will include statistics relating to population (including Sex, Age and Marital Condition), Acreages, Private Families, Rooms, Dwellings and Institutions.

A price is inserted against each county for which the volume has been published—other volumes will follow in the order given, at short intervals.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 8th OCTOBER, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the fortieth week of the year numbered 6,025 corresponding to an annual rate of 15·3 per 1,000 living: stillbirths numbered 258 corresponding to a rate of 41 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,998 (150 more than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 52, against 56, 50, and 54 in the preceding three weeks.

Annual Death-Rates.

* The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

DATE, OCTOBER		ATMOSPHERIC ELECTRICITY. (For explanation of symbols, see Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.	
Sunday	2		6.3	11.6	Partially cloudy till 11 $\frac{1}{2}$ h.; overcast till 1 $\frac{1}{2}$ h.; partially cloudy till 1 $\frac{1}{2}$ h.; overcast till 17 $\frac{1}{2}$ h.; then becoming cloudless by 18 $\frac{1}{2}$ h. Shower at 16 $\frac{1}{2}$ h. Hoar frost in morning. Dew at night.	<p>The results apply to the Civil Day or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.</p> <p>Observations are usually taken at 9h. A.M., noon 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.</p> <p>The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.</p> <p>The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: - p, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions. l, h, signify potential less than 150 volts and greater than 500 volts, respectively.</p> <p>The numbers in column 23, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of <i>bright</i> sunshine on each day.</p> <p>The reading of the barometer increased from 29.83 ins. at the beginning of the week to 29.85 ins. by 2h. on October 2nd; decreased to 29.64 ins. by 1$\frac{1}{2}$h. on October 2nd; increased generally to 30.01 ins. by 9h. on October 4th; decreased generally and was 28.95 ins. by midnight on October 8th.</p>
Monday	3		0.6	11.5	Nearly cloudless till 7h.; overcast till 19h.; then cloudy. Showers at 13 $\frac{1}{2}$ h.; and 1 $\frac{1}{2}$ h. till 15 $\frac{1}{2}$ h. Mist in morning.	
Tuesday	4		7.6	11.4	Nearly cloudless generally till 16 $\frac{1}{2}$ h.; variably cloudy till 22h.; then overcast. Hoar frost and mist in morning. Fog from 18h. till 22h. Dew at night.	
Wednesday	5		5.7	11.4	Overcast till 7h.; nearly cloudless till 12 $\frac{1}{2}$ h.; then overcast generally. Haze 9h. till 15h. Mist 18h. till 22h. Dew in morning and at night.	
Thursday	6		6.9	11.3	Cloudless till 10h.; overcast till 13h.; variably cloudy till 15 $\frac{1}{2}$ h.; nearly cloudless till 22h.; then becoming overcast by 23h. Parhelion 16 $\frac{1}{2}$ h. till 17h. Hoar frost in morning.	
Friday	7		2.4	11.3	Overcast till 11h.; cloudy till 14 $\frac{1}{2}$ h.; overcast till 22 $\frac{1}{2}$ h.; then partially cloudy. Shower at 16 $\frac{1}{2}$ h.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 15th OCTOBER, 1932.

BIRTHS AND DEATHS.

In the 113 County Boroughs and Great Towns of England and Wales the live births registered in the forty-first week of the year numbered 5,860 corresponding to an annual rate of 14.9 per 1,000 living: stillbirths numbered 276 corresponding to a rate of 45 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,091 (93 more than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 50, against 50.54, and 52 in the preceding three weeks.

Annual Death-Rates.

* Including Ulcer of stomach or duodenum.

Table 3.—Notifications of Infectious Diseases.

Number of cases (civilians) notified in the week ended 15th October, 1932, in
Administrative Areas and Port Sanitary Districts with Summary for
England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Encephalitis ethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

	Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).		Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).

* The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

Monday	10		9 2	11 1	Cloudless till 11h.; partially cloudy till 17h.; variably cloudy till 22h.; then over- cast. Rain from 23h. Lunar halo 21h. till 23h. Dew and hear frost in morning.
Tuesday	11		0 4	11 0	Overcast generally. Rain till 3h.; fr-m 74h. till 94h.; and from 14h. till 17h.; then slight rain till 18h. Thunderstorm till 16h. Mist at night.
Wednesday	12		5 7	10 9	Overcast till 24h.; nearly cloudless till 13h.; then overcast generally. Damping 20h. till 22h.; then heavy rain till 23h. Mist till 12h.
Thursday	13		3 5	10 9	Nearly overcast till 12h.; cloudy till 18h.; then cloudless. Slight rain till 3h.; then rain till 6h. Showers between 74h. and 94h.; at 84h.; 104h. and 154h. Fresh wind 2h. till 4h.; 6h. till 8h.; and 10h. till 19h.
Friday	14		2 3	10 8	Nearly overcast till 15h.; nearly cloud- less till 184h.; then overcast. Slight rain 3h. till 6h.; 74h. till 224h.; and from 234h. Rain 6h. till 84h. Mist in morning.
Saturday	15		2 7	10 7	Overcast till 3h.; cloudy till 114h.; then overcast. Slight rain till 1h. Rain from 23h.
Sum			Sum	Sum	
23 8			26	76 5	
No. of Column			25	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 159 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon 3h. P.M. and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic record made during the 50 years ending 1903. With the corrected mean readings of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 56 years ending 1903, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: - p, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unusually conditions, l, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 28, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of bright sunshine on each day.

The reading of the barometer decreased from 28.95 ins. at the beginning of the week to 28.90 ins. by 6h. on October 9th; increased to 29.06 ins. by 11h. on October 12th; decreased to 29.17 ins. by 9h. on October 14th; increased to 29.75 ins. by 21h. on October 15th; decreased and was 29.72 ins. by midnight on the same day.

Observations temporarily suspended during building operations.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 22nd OCTOBER, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the forty-second week of the year numbered 6,087 corresponding to an annual rate of 15·5 per 1,000 living: stillbirths numbered 249 corresponding to a rate of 39 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,353 (262 more than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 52, against 54, 52, and 50 in the preceding three weeks.

* The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

DATE.	OCTOBER	ATMOSPHERIC ELECTRICITY. (For explanation of symbols, see Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.	
Sunday	16		1.5	10.7	Overcast till 14h.; then variably cloudy. Rain till 4h.; then slight rain till 5h.	
Monday	17		1.8	10.6	Very cloudy till 9h.; nearly overcast till 15h.; variably cloudy till 21h.; then nearly overcast. Shower 21h. Dew in morning.	
Tuesday	18		6.4	10.6	Nearly overcast till 5h.; partially cloudy till 9h.; nearly overcast till 11h.; then partially cloudy. Rain at 4h. Slight mist 15h. till 21h. Fresh wind 1h. till 18h.; rising to strong 4h. till 11h. Dew at night.	
Wednesday	19		4.9	10.5	Cloudless till 12h.; becoming overcast by 14h. Mist 7h. till 8h.; then fog till 11h. Damping 14h. till 21h.; then rain.	
Thursday	20		0.0	10.4	Overcast throughout. Occasional damping between 2h. and 9h.; and from 15h. till 17h.; then rain. Mist from 16h. Fresh wind 1h. till 6h.	
Friday	21		3.5	10.4	Overcast till 7h.; partially cloudy till 11h.; then overcast. Rain till 3h.; and 14h. till 18h. Damping 3h. till 7h.; 13h. till 14h.; and between 18h. and 21h. Fresh wind 7h. till 12h.; and occasionally after 20h.	
Saturday	22		0.6	10.3	Cloudy till 8h.; overcast till 16h.; variably cloudy till 20h.; then partially cloudy. Damping 14h. till 15h. Heavy shower at 13h.; and light shower at 15h. Fresh wind till 17h.	
No. of Column ..		25	Sum 18.7	Sum 73.5		27

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 162 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M. and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 55 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*," and - "*lower*" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: - P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions. *h*, *h*, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29.72 ins. at the beginning of the week to 29.63 ins. by 6h. on October 16th; increased to 29.91 ins. by 18h. on October 17th; decreased to 29.55 ins. by 4h. on October 18th; increased to 30.06 ins. by 8h. on October 19th; decreased to 29.23 ins. by 3h. on October 21st; increased and was 29.77 ins. by midnight on October 22nd.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 29th OCTOBER, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the forty-third week of the year numbered 5,924 corresponding to an annual rate of 15.0 per 1,000 living: stillbirths numbered 266 corresponding to a rate of 43 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,133 (220 less than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 50, against 52, 50, and 52 in the preceding three weeks.

In London (Administrative County including the City of London) there were 1,143 live births registered corresponding to an annual rate of 13.6 per 1,000 living : stillbirths numbered 42 corresponding to a rate of 35 per 1,000 total births (including stillborn) : the civilian deaths (excluding stillbirths) numbered 895 (24 less than the number in the preceding week) : infant mortality, based on the average weekly number of live births during the last 52 weeks, was 52, against 46, 50 and 56 in the preceding three weeks.

MONTHLY STATEMENT OF DEATHS FROM SMALL-POX IN ENGLAND AND WALES.

There was no death from Small-pox in the returns received from areas outside Greater London, the County Boroughs and Great Towns, for the month of September last.

Notifications of Infectious Diseases.

	England and Wales.			London (Administrative County).		
	Actual.	Expected.	Per cent.	Actual.	Expected.	Per cent.
Scarlet fever	2,281	2,143	106	440	313	141
Diphtheria	986	1,177	84	187	305	61
Acute pneumonia (primary or influenzal).	838	848	99	99	106	93
Enteric (including Paratyphoid) fever.	138	74	186	5	?	?

The numbers of "expected" notifications shown in the above table are based on the Median Value of the corresponding weeks of 1923-31.

Table 1.—118 County Boroughs and Great Towns, Greater London, and Four Scottish and Irish Towns.

* The totals in the last two columns relate to the 108 towns common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

DATE.	OCTOBER	ATMOSPHERIC ELECTRICITY. (For explanation of symbols, see Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.	Observations suspended temporarily during building operations.
Sunday	23		1-0	10-2	Cloudy till 4h.; overcast till 20h.; then partially cloudy. Rain 4h. till 6h.; 10h. till 13h.; and 14h. till 20h. with heavy rain 16h. till 18h.	
Monday	24		0-0	10-2	Overcast till 21h.; becoming cloudless by 22h. Shower at 10h. Rain 10h. till 11h. Slight rain 12h. till 14h.; and 18h. till 16h. Gloom 12h. till 14h. Slight mist and dew at night.	
Tuesday	25		2-4	10-1	Cloudless till 5h.; partially cloudy till 10h.; then overcast. Rain 20h. till 20h.; and from 22h. Solar halo 10h. till 11h. Mist and slight hoar frost in morning.	
Wednesday	26		2-6	10-0	Overcast till 6h.; then variably cloudy till 19h.; then nearly cloudless. Rain till 3h. Showers at 7h.; 10h.; 13h. and 14h. Fresh wind 1h. till 14h. Dew at night.	
Thursday	27		1-8	10-0	Nearly cloudless till 7h.; overcast till 12h.; variably cloudy till 17h.; then overcast. Shower at 8h. Rain 9h. till 11h.; and from 20h.	
Friday	28		0-0	9-9	Overcast till 18h.; becoming cloudless by 19h. Rain till 14h.; and from 13h. till 17h. Hoar frost at night.	
Saturday	29		0-9	9-9	Cloudless till 10h.; becoming overcast by 11h. Rain 15h. till 23h. Fog 7h. till 12h. Solar halo 10h. till 11h. Hoar frost in morning.	
No. of Column ..			Sum 8-7	Sum 70-3		25
			26	27		

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records of the barometer during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1918. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: - P, positive; N, negative; L, low; m, moderate; h, high; d, disturbed or unsteady conditions. L, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 28, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of bright sunshine on each day.

The reading of the barometer decreased from 29-77 ins. at the beginning of the week to 29-43 ins. by 19h. on October 23rd; increased to 29-55 ins. by 1h. on October 24th; decreased to 29-44 ins. by 12h. on October 24th; increased to 29-81 ins. by 9h. on October 25th; decreased to 29-19 ins. by 5h. on October 26th; increased to 29-47 ins. by 23h. on October 26th; decreased to 29-11 ins. by 0h. on October 28th; increased to 29-71 by 7h. on October 29th; decreased and was 29-08 ins. by midnight on the same day.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 5th NOVEMBER, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the forty-fourth week of the year numbered 6,164 corresponding to an annual rate of 15·6 per 1,000 living: stillbirths numbered 233 corresponding to a rate of 36 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,299 (166 more than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 60, against 50, 52, and 50 in the preceding three weeks.

* Including Ulcer of stomach or duodenum.

Table 3.—Notifications of Infectious Diseases.

Number of cases (civilians) notified in the week ended 5th November, 1932, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

	Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).		Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).

DATE.	OCTOBER	ATMOSPHERIC ELECTRICITY. (For explanation of symbols, see Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.
Sunday	30		0.0	9.8	Very cloudy till 8h.; then overcast generally. Rain about 2h.; and 12h. till 14h. Shower at 15h. Fresh wind generally from 9h.
Monday	31		1.1	9.7	Very cloudy till 3h.; overcast till 11h.; then variably cloudy. Slight rain 4h. till 7h. Shower at 16h. Fresh wind till 5h.
NOVEMBER Tuesday	1		0.1	9.7	Variably cloudy till 10h.; overcast till 18h.; variably cloudy till 22h.; then overcast. Shower at 11h. Slight rain 11h. till 16h. Mist from 1h. Hoar frost in morning. Dew at night.
Wednesday	2		0.1	9.6	Overcast generally. Showers at 3h.; 10h.; and 12h. Mist till 9h.
Thursday	3		0.3	9.6	Overcast till 14h.; very cloudy till 21h.; overcast till 22h.; then partially cloudy. Dew at night.
Friday	4		1.0	9.5	Overcast generally. Slight shower at 18h. Slight rain 18h. till 21h.; then damping till 23h.
Saturday	5		2.4	9.5	Overcast till 10h.; partially cloudy till 12h.; overcast till 19h.; then cloudless from 20h. Slight mist from 20h. Dew at night.
No. of Column ..			Sum 5.0	Sum 67.4	
		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 15 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 85 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: - P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions. l, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of bright sunshine on each day.

The reading of the barometer decreased from 29.08 ins. at the beginning of the week to 29.05 ins. by 3h. on October 30th; increased generally to 30.12 ins. by 8h. on November 3rd; decreased to 29.75 ins. by 18h. on November 4th; increased and was 30.29 ins. by midnight on November 5th.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 12th NOVEMBER, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the forty-fifth week of the year numbered 5,953 corresponding to an annual rate of 15.1 per 1,000 living: stillbirths numbered 257 corresponding to a rate of 41 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,169 (130 less than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 56, against 52, 50, and 60 in the preceding three weeks.

		26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the column of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 55 years ending 1906, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: - P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions. l, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 30.29 ins. at the beginning of the week to 29.77 ins. by 5h. on November 8th; increased generally and was 30.29 ins. by midnight on November 12th.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the diem of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon 3h. P.M. and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean readings of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: -p positive; N, negative; l, low; m, moderate; h, high; a, disturbed or unsteady conditions. l, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26 derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of bright sunshine on each day. The reading of the barometer decreased from 30.29 ins. at the beginning of the week to 29.77 ins. by 5h. on November 8th; increased generally and was 30.29 ins. by midnight on November 12th.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 19th NOVEMBER, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the forty-sixth week of the year numbered 5,718 corresponding to an annual rate of 14.5 per 1,000 living: stillbirths numbered 268 corresponding to a rate of 45 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,236 (67 more than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 60, against 50, 60, and 56 in the preceding three weeks.

Saturday .. 19		0'0	8'7	Overcast throughout. Damping 0h. till 6 ³⁰ h.; and generally from 10h. till 22h. Fog from 6h.
<div>Sum 2.2</div> <div>Sum 61.8</div>				
No. of Column ..	25	26	27	

The results apply to the Civil Day, or from midnight to midnight, (Greenwich Mean Time). The height of the cistern of the barometer is 162 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 60 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1906, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*," and - "*lower*" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: -P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions. l, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 30.28 ins. at the beginning of the week to 30.36 ins. by 10h. on November 13th; decreased to 29.97 ins. by 20h. on November 15th; increased to 30.03 ins. by 18h. on November 16th; decreased and was 29.68 ins. by midnight on November 19th.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 26th NOVEMBER, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the forty-seventh week of the year numbered 5,712 corresponding to an annual rate of 14.5 per 1,000 living: stillbirths numbered 254 corresponding to a rate of 43 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,481 (245 more than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 62, against 60, 56, and 60 in the preceding three weeks.

In London (Administrative County including the City of London) there were 1,221 live births registered corresponding to an annual rate of 14.6 per 1,000 living : stillbirths numbered 46 corresponding to a rate of 36 per 1,000 total births (including stillborn): the civilian deaths (excluding stillbirths) numbered 933 (19 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 56, against 58, 69, and 67 in the preceding three weeks.

MONTHLY STATEMENT OF DEATHS FROM SMALL-POX IN ENGLAND AND WALES.

There was no death from Small-pox in the returns received from areas outside Greater London, the County Boroughs and Great Towns, for the month of October last.

Notifications of Infectious Diseases.

	England and Wales.			London (Administrative County).		
	Actual.	Expected.	Per cent.	Actual.	Expected.	Per cent.

			Registered Sunshine in hours.	Sun above Horizon in hours.	
Sunday	20		0.0	8.8	Overcast. Damping 9h. till 10h. Slight rain from 21h. Fog till 16h.; then mist.
Monday	21		1.8	8.8	Overcast till 5h.; then partially cloudy generally. Slight rain till 6h. Mist till 7h.; and from 18h. till 21h. Fog. 7h. till 11h.
Tuesday	22		0.0	8.5	Partially cloudy till 4h.; overcast generally till 23h.; then partially cloudy. Slight rain 9h. till 12h.; then rain till 18h. Lunar halo 4h. till 6h. Fresh wind 11h. till 16h. Hoar frost in morning.
Wednesday	23		1.3	8.5	Variably cloudy till 18h.; then cloudless. Rain 12h. till 12h. Dew at night.
Thursday	24		1.6	8.4	Cloudless till 23h.; very cloudy till 10h.; partially cloudy till 12h.; then overcast. Shower 15h. Slight rain from 22h. Solar halo at 9h. Mist and dew in morning.
Friday	25		0.1	8.4	Overcast generally. Slight rain till 6h. Fresh wind 1h. till 9h.
Saturday	26		0.1	8.4	Very cloudy till 7h.; overcast till 12h.; then very cloudy generally till 16h.; then nearly cloudless by 17h. Shower at 7h. Occasional slight showers between 9h. and 12h. Fresh wind from 6h.
Observations suspended temporarily during building operations.			Sum 4.9	Sum 59.4	
No. of Column ..			26	27	
25					

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 163 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 56 years ending 1906, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: - P. positive; N. negative; l. low; m. moderate; h. high; d. disturbed or unsteady conditions. l, h., signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29.68 ins. at the beginning of the week to 29.62 ins. by 3h. on November 21st; increased to 29.82 ins. by 21h. on November 21st; decreased to 29.73 ins. by 17h. on November 22nd; increased to 29.89 ins. by 21h. on November 25th; decreased generally and was 29.56 ins. by midnight on November 26th

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 3rd DECEMBER, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the forty-eighth week of the year numbered 5,566 corresponding to an annual rate of 14.1 per 1,000 living: stillbirths numbered 220 corresponding to a rate of 38 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,500 (19 more than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 70, against 56, 60, and 62 in the preceding three weeks.

* The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean readings of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*," and - "*lower*," than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: -P, positive; N, negative; L, low; M, moderate; H, high; d, disturbed or unsteady conditions; L^h, highly potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26 derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of *bright* sunshine on any day. The reading of the barometer increased generally from 29·56 ins. at the beginning of the week to 30·29 ins. by 21h. on November 28th; decreased to 29·50 ins. by 7h. on December 1st; increased to 29·60 ins. by 21h. on December 1st; decreased to 29·27 ins. by 0h. on December 3rd; increased generally and was 29·35 ins. by midnight on the same day.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 10th DECEMBER, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the forty-ninth week of the year numbered 5,759 corresponding to an annual rate of 14.6 per 1,000 living: stillbirths numbered 296 corresponding to a rate of 49 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,751 (251 more than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 67, against 60, 62, and 70 in the preceding three weeks.

* The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the applica-
tion of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 46 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: +, P. positive; N. negative; l. low; m. moderate; h. high; d. disturbed or unsteady con-
ditions. l., h., signify potential less than 150 volts and greater than 600 volts, respectively.

The numbers in column 28, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of bright sunshine on each day.

The reading of the barometer increased from 29.35 ins. at 10.0 beginning of the week to 30.13 ins. by 19h. on December 7th, decreased to 30.08 ins. by 15h. on December 8th; increased to 30.14 ins. by 11h. on December 9th; de-
creased and was 29.94 ins. by midnight on December 10th.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 17th DECEMBER, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the fiftieth week of the year numbered 5,722 corresponding to an annual rate of 14.5 per 1,000 living: stillbirths numbered 271 corresponding to a rate of 45 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 5,185 (434 more than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 77, against 62, 70, and 67 in the preceding three weeks.

* Including Ulcer of stomach or duodenum.

Table 3.—Notifications of Infectious Diseases.

Number of cases (civilians) notified in the week ended 17th December, 1932, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the 6th column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

	Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).		Small-pox.	Scarlet fever.	Diphtheria.	Enteric fever.	Pneumonia.	Other diseases (see note at head of table).

* The totals in the last two columns relate to the 106 towns common to both the 1931 and 1932 lists. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

		25	26			

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With this corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 55 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and - "lower" than the average. The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: - P, positive; N, negative; L, low; m, moderate; h, high; d, disturbed or unsteady conditions. L, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument, show the aggregate duration of bright sunshine on each day.

The reading of the barometer decreased generally from 29.94 ins. at the beginning of the week to 29.71 ins. by 15h. on December 13th; increased generally to 30.20 ins. by 1h. on December 16th; decreased and was 29.81 ins. by midnight on December 17th.

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 24th DECEMBER, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the fifty-first week of the year numbered 5,657 corresponding to an annual rate of 14.4 per 1,000 living: stillbirths numbered 277 corresponding to a rate of 47 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 5,153 (32 less than the number in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 71, against 70, 67, and 77 in the preceding three weeks.

Sunday	18		2.4	7.8	Overcast till 12 ³⁰ h.; then nearly cloudless. Dew at night.	
Monday	19		1.2	7.8	Nearly cloudless till 8h.; nearly overcast till 12h.; then clearing to cloudless by 1 ³⁰ h. Dew in morning and at night.	
Tuesday	20		0.1	7.8	Variably cloudy till 9h.; nearly overcast till 14 ³⁰ h.; very cloudy till 1 ³⁰ h.; nearly cloudless till 2 ³⁰ h.; then partially cloudy. Dew in morning and at night.	
Wednesday	21		3.4	7.8	Partially cloudy till 4h.; overcast till 10 ³⁰ h.; partially cloudy generally till 18h.; then nearly overcast. Damping 8h. till 9h. Dew at night.	
Thursday	22		5.0	7.8	Nearly overcast till 8h.; partially cloudy till 1 ³⁰ h.; overcast till 22h.; then very cloudy. Rain 5 ³⁰ h. till 7 ³⁰ h.	
Friday	23		2.4	7.8	Very cloudy till 9h.; then overcast generally. Solar halo till 1 ³⁰ h. Slight rain 1 ³⁰ h. till 1 ³⁰ h.; then rain till 22h.	
Saturday	24		3.6	7.8	Overcast till 1h.; cloudless till 14 ³⁰ h.; partially cloudy till 1 ³⁰ h.; overcast till 21h.; then becoming cloudless by 22h. Fog 7h. till 11h.; then mist till 22h. Dew in morning.	
No. of Column ..			Sum 18.1	Sum 54.6		
		25	26	27		

Observations suspended temporarily during building operations.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the column of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M. and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher" and - "lower" than the average.

The values given in column 16 are not corrected for the index error of the thermometer which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: -P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions; l, h, signify potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26 derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of bright sunshine on each day.

The reading of the barometer decreased from 29.91 ins. at the beginning of the week to 29.83 ins. by 14h. on December 19th; increased to 29.94 ins. by 21h. on December 20th; decreased to 29.86 ins. by 4h. on December 22nd; increased to 29.98 ins. by 20h. on December 23rd; decreased to 29.84 ins. by 15h. on December 24th; increased and was 30.54 ins. by midnight on December 24th.

1932. No. 52.

THE
REGISTRAR-GENERAL'S

WEEKLY RETURN OF
BIRTHS AND DEATHS

REGISTERED IN COUNTY BOROUGH
AND OTHER GREAT TOWNS AND
OF CASES OF CERTAIN SPECIFIED
INFECTIOUS DISEASES

NOTIFIED IN BOROUGH, URBAN &
RURAL DISTRICTS & PORT SANITARY
DISTRICTS IN ENGLAND AND WALES

EXPLANATORY STATEMENT.

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (a) London and (b) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 31st DECEMBER, 1932.

BIRTHS AND DEATHS.

In the 118 County Boroughs and Great Towns of England and Wales the live births registered in the fifty-second week of the year numbered 4,893 corresponding to an annual rate of 12.4 per 1,000 living: stillbirths numbered 253 corresponding to a rate of 49 per 1,000 total births registered (including stillborn): the civilian deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 5,545 (392 more than the number in the preceding week). During the last four weeks deaths from Influenza numbered 68, 85, 120 and 303 respectively.

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 75, against 67, 77, and 71 in the preceding three weeks.

Annual Death-Rates.

		Dec. 10, 1932.	Dec. 17, 1932.	Dec. 24, 1932.	Dec. 31, 1932.

Liverpool		14.8	15.3	15.2	16.9
Manchester		12.5	12.9	13.4	14.4
Newcastle-upon-Tyne ...		13.6	13.4	17.5	23.0
Nottingham		7.7	10.4	11.5	14.4
Sheffield		13.6	11.9	12.9	11.2
Stoke-on-Trent		10.8	14.0	14.3	14.0
West Ham		9.5	14.8	9.5	12.1

In London (Administrative County including the City of London) there were 1,030 live births registered corresponding to an annual rate of 12.3 per 1,000 living : stillbirths numbered 38 corresponding to a rate of 36 per 1,000 total births (including stillborn) : the civilian deaths (excluding stillbirths) numbered 1,109 (88 more than the number in the preceding week) : infant mortality, based on the average weekly number of live births during the last 52 weeks, was 54, against 64, 84, and 65 in the preceding three weeks.

NOTE.—The abnormally low number of live births registered during the week is mainly due to delay in registration owing to the Christmas Holiday.

Notifications of Infectious Diseases.

	England and Wales.			London (Administrative County).		
	Actual.	Expected.	Per cent.	Actual.	Expected.	Per cent.
Scarlet fever	2,033	1,595	127	309	249	124
Diphtheria	825	1,069	77	144	204	71
Acute pneumonia (primary or influenzal).	2,017	1,514	133	163	172	95
Enteric (including Paratyphoid) fever.	27	38	71	1	?	?

The numbers of "expected" notifications shown in the above table are based on the Median Value of the corresponding weeks of 1923-31.

Table 1.—118 County Boroughs and Great Towns, Greater London, and Four Scottish and Irish Towns.

BIRTHS and DEATHS* registered in the week ended 31st December, 1932.

* The totals in the last two columns relate to the 108 towns common to both the 1931 and 1932 lists. The live are derived from the weekly returns furnished by the Registrars and differ from those published for the Towns Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

DATE.	ATMOSPHERIC ELECTRICITY. (For explanation of symbols, see Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.	
DECEMBER					
Sunday .. 25		0'0	7'8	Cloudless till 3h.; then becoming over- cast by 4h. Mist 4h. till 6h.; then fog.	
Monday .. 26		0'0	7'9	Overcast throughout. Fog till 2h.; mist till 7h.; then fog till 21h.	
Tuesday .. 27		0'0	7'9	Overcast throughout. Mist 8h. till 9h.; then fog till 11h. Frequent slight damp- ing between 13h. and 15h.	
Wednesday 28		3'0	7'9	Overcast till 6h.; partially cloudy till 11h.; then overcast from 12h. Damping about 2h. Slight shower at 20h.	
Thursday .. 29		0'0	7'9	Overcast, Damping 13h. till 16h.; and from 23h. Rain 16h. till 19h	
Friday .. 30		0'0	7'9	Overcast till 20h.; partially cloudy till 21h.; then cloudless. Damping till 4h.; and from 14h. till 17h.; with rain 15h. till 17h. Dew at night.	
Saturday .. 31		0'6	7'9	Cloudless till 3h.; partially cloudy till 9h.; nearly overcast till 15h.; cloudy till 22h.; then overcast. Solar halo 10h. till 10h. Damping from 23h. Hoar frost in morning. Slight dew at night.	
No. of Column ..	25	Sum 3'6	Sum 56'2		27

Observations suspended temporarily during building operations.

The results apply to the Civil Day, or from midnight to midnight (Greenwich Mean Time). The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer are converted into decimal values by the application of corrections deduced from a discussion of the photographic records made during the 80 years ending 1906. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observational readings at Greenwich during the 85 years ending 1906, and that of the vertical movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "higher," and "lower" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The Record of Atmospheric Electricity is derived from Thomson's self-registering Electrometer and indicates the Potential Gradient in volts per metre above the surface of the ground. The symbols employed are: — P, positive; N, negative; l, low; m, moderate; h, high; d, disturbed or unsteady conditions; L, highly, significantly potential less than 150 volts and greater than 500 volts, respectively.

The numbers in column 26 derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of bright sunshine on each day.

The readings of the barometer increased from 30.54 ins. at the beginning of the year to 30.79 ins. by 11h. on 26th; decreased to 29.53 ins. by 16h. on 30th; increased to 29.71 ins. by 6h. on 31st; decreased and was 29.49 ins. by midnight on the same day.

*With the Registrar-General's
Compliments.*
